## Notes:

There are different ways to transcribe the word "Unicode", depending on the language and script. In some cases there is only one language that customarily uses a given script; in others there are many languages. The goal here is at a minimum to collect at least one transcription for each script in a language customarily written in that script, with more languages if possible. If the transcription is the same for multiple languages in a script, then a single representative language is used.

Still missing are transcriptions for the items above in RED (in at least one language). I would appreciate any other transcriptions, or corrections for the ones listed here. Send to mark3@macchiato.com, using the directions below:

## - Supplying Missing Items

- Most Latin-script languages will follow the spelling, and change the pronunciation. For any that would not, it would be good to have the alternate spelling.
- For non-Latin scripts the goal is to match the English pronunciation - not spelling. Above is the IPA (in phonemic transcription) that should be matched as closely as possible (without sounding affected in the target language)
- Text would be best in either the UTF-8 text, or the code points in hex HTML. E.g. either of the following:

■ "Юникод"
■ "\&\#x042E;\&\#x043D;\&\#x0438;\&\#x043A;\&\#x043E;\&\#x0434;"

- Note: for supplementary characters, there should be one hex number per code point, not two surrogates:

■ \&\#x10000; not \&\#xD800; \&xDC00;

- If you have a good font, I'd also appreciate a GIF. It should be $96 \times 24$ bits, with the text centered, in black on white (plus grays if smoothed).

## - Other Comments

- Because some browsers won't handle the text, both text and GIF image are supplied. If you can't read the text columns, see Display Problems.
- The Chinese versions (inc. Bopomofo) are translations, not transcriptions, since "transcription in Chinese is pretty lame" [J. Becker].
- There are other "translations" of Unicode that may be in use, such as the Vietnamese "Thống Nhất Mã".
- For sample pages in different languages on the Unicode site, see What is Unicode?
- Americans are not generally used to IPA, and find a variety of different systems in their dictionaries. This one leaves the base letters as they are, and uses diacritics for pronunciation.

## - Etymology of Unicode

- Coined by J. Becker. Not related to previous usages, such as:
- A telegraphic code in which one word or set of letters represents a sentence or phrase; a telegram or message in this. (late 19th century, OED)
- According to my references, the prefix "uni" is directly from Latin while the word "code" is through French.
- The original Indo-European apparently would have been *oino-kau-do ("one strike give"): *kau apparently being related to such English words as: hew, haggle, hoe, hag, hay, hack, caudad, caudal, caudate, caudex, coda, codex, codicil, coward, incus, and Kovač (personal name: "smith").
- I will leave the exact derivations to the exegetes, but I like the association with "haggle" myself.

## - Contributions

- This draws on contributions or comments from:
- Dixon Au
- Joe Becker
- Maurice Bauhahn
- Abel Cheung
- Peter Constable
- Michael Everson
- Christopher John Fynn
- Michael Kaplan
- George Kiraz
- Abdul Malik
- Siva Nataraja
- Roozbeh Pournader
