

## ISO/IEC JTC 1/SC 2/WG2 N4435

Date: 2013-05-27

**Title: Presentation of vertical scripts****Source: Project Editor****Distribution: WG2 members and liaison organizations**

The following document describes a proposed change to the way scripts laid out vertically are presented in the code charts of the standard.

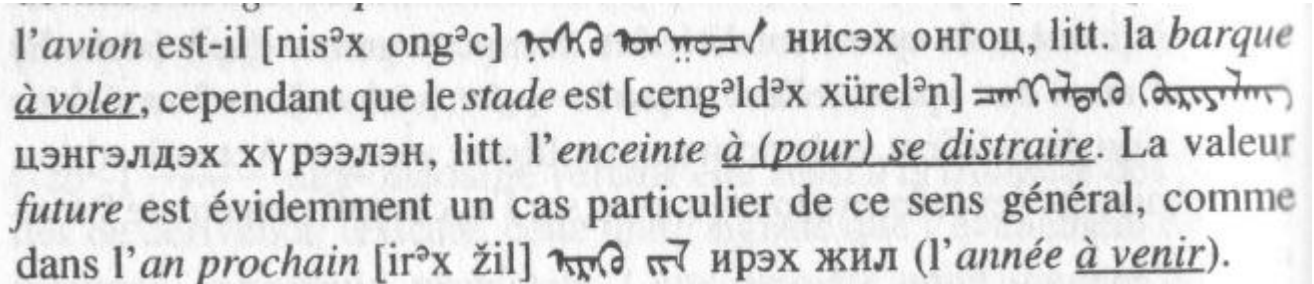

**Background:**

The document WG2 N4434 about “Math characters and variation sequences” mentions the following issue:

*Based on the current design of the charts, there is no easy solution to display the representation of variation sequences for scripts which are typically represented vertically (such as Mongolian and Phags-pa). The main reason is that commercial/production fonts that represent these characters are designed with characters laid in horizontal flow, not vertical. These commercial fonts contain these variants and it would be easier to use them accordingly for these representations.*

While not always the case, the fonts used for chart productions are very similar to fonts in real use. In many cases, such commercial or open source based fonts are used for chart purposes. In addition, font designers use the published charts as a source of inspiration, or at least as a reference point for their own design.

In that aspect, the presentation of the scripts laid out vertically is misleading because all ‘real use’ fonts are designed in horizontal flow and rotated vertically if the script is typically laid out that way. This has the added benefit of allowing easy horizontal layout when the script is rendered in that fashion. Although not usual, Mongolian is sometimes rendered horizontally:

*l'avion est-il [nis²x ong²c] ᠨᠢᠰᠢᠬᠡ ᠣᠨᠭᠣᠴᠢ, litt. la barque à voler, cependant que le stade est [ceng²ld²x xürel²n] ᠴᠡᠩᠭᠡᠯᠳᠡᠬᠡ ᠬᠦᠷᠡᠭᠡᠯᠡᠨ, litt. l'enceinte à (pour) se distraire. La valeur future est évidemment un cas particulier de ce sens général, comme dans l'an prochain [ir²x žil] ᠶᠢᠷᠡᠬᠡ ᠵᠢᠯ (l'année à venir).*

(Example found in the Unicode Technical Report #50 mentioned below)

Finally, a Unicode Technical report “Unicode Vertical Text Layout” is being worked on and is available at (<http://www.unicode.org/reports/tr50/>) which “describes a Unicode character property which can serve as a stable default orientation of characters for reliable document interchange.” One of the reference points for the establishment of that property is the way characters are shown in the code charts. This is again a situation where the difference between actual implementation and code chart display is misleading.

## Proposed solution

The solution is to display these scripts in their horizontal layout in the code charts to be consistent with actual implementation of these scripts in fonts used to display them.

The major benefit for chart production is that it becomes very easy to produce the variation sequences associated with these scripts because every 'real use' font has them.

If this was adopted, two scripts representations would need to be updated: Mongolian and Phags-pa. It would also impact future representation in the code charts of similar vertical scripts not yet encoded.

The following pages shows the Mongolian block, first in vertical mode (as currently shown in the standard), and then in horizontal mode. The horizontal block version shows all the variation sequences demonstrating the benefit of that presentation because these were available in the implemented font. The horizontal version was done using the "Mongolian Baiti" font included in Microsoft Windows 7.

There is some urgency to take a position on this matter as it affects important works on vertical layout implementation guided by UTR#50. For example, the W3C Cascading Style Sheet (CSS) Working Group is eager to get a stable definition for script vertical property.

And again, adopting the change would make very easy to show the variation sequences associated with these scripts.

## Possible errata

Comparing the representation of these standardized variation sequences and the glyphs described by Unicode in <http://www.unicode.org/Public/UNIDATA/StandardizedVariants.html> notable differences were found for the following sequences:

- 1825 180B medial
- 1826 180B medial
- 1874 180D medial (difference is minor)
- 1887 180B final
- 1887 180D final

While ISO/IEC 10646 does not document yet these representations, this clearly demonstrates the benefit of using a 'real use' font to validate data exposed by the standard.

In addition, the 'real use' fonts has many more variant glyphs, so it is possible that the list of Mongolian standardized variations should also be expanded.
