## Title: Proposal to encode 12 cossic characters

Source: Uwe Mayer, Siegmund Probst, David Rabouin, Elisabeth Rinner, Andreas Stötzner,  
Achim Trunk, Charlotte Wahl

Version: 4th revised version

Previous versions: L-2438, L-2509, L-2518

Related: Commentary doc.s L-2506, L-2512; L-2516n – see appendix

Status: forward to Script Encoding Working Group / WG2

Action: for expert review and encoding pipeline

Date: September 30, 2025

Requester's reference: LUCP L-2527

### 1. 4<sup>th</sup> revision of the Cossic proposal

There is one minor change and one significant change in this proposal, regarding the previous version. The minor thing is: with regard to LOWERCASE KURRENT Z as a variation sequence of 1D4CF, we now reference an analogue case presented in our proposal L-2520 (N5335), the two instances of the same sort of character may strengthen the case pro encoding.

A significant change has been made to the character names of three root characters, according to a recommendation we received from the UTC the names now reflect their historic nomenclature more directly.

### 2. About Coss or cossic characters

“Coss” (or “Cofs”, historic) is a German term for written or printed treatises about Algebra.

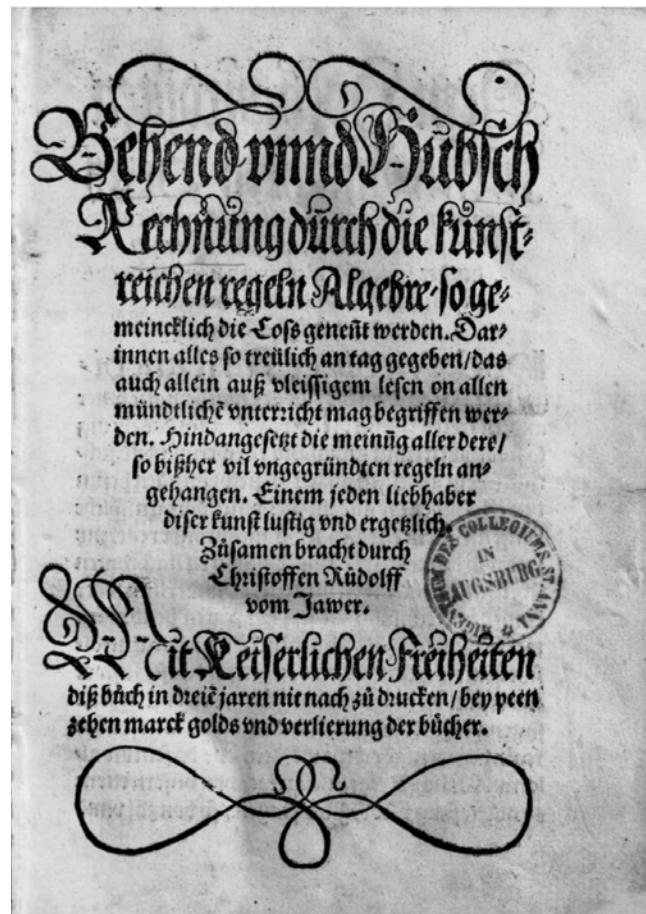

It derives from Italian *cosa* (“thing”) which was used to denote variables in calculations.

The first printed “Coss” was a book by German mathematician Christoff Rudolff (ca. 1500 – before 1543): *Behend und hübsch Rechnung durch die kunstreichen regeln Algebre, so gemeinlich die Coss genen̄t werden.* (“Handy and neat calculation by the artful Algebre rules, commonly so called the Coss.”) The work was based on older algebra manuscripts which the author studied in Vienna. The book was released in Straßburg in 1525 and was out of stock soon. Because it was such a sought-after title, Michael Stifel edited a new and extended version of Rudolff’s Coss in 1553.

In the 1525 edition the character “√” was used the first time for *radix* in print. For the expression of powers (up to ninth) Rudolff used a set of special abbreviation characters. Some of them were common in writing at the time (and used for different purposes), some were rather special additions. Since this set of cossic characters appears explicitly for a longer time in mathematical literature, we see a need to have them encoded, in order to enable precise content encoding in facsimile transcriptions of the historic sources.

### 3. Characters

The cossic characters set consists of two sub-groups. Group 1 is a range of 8 Latin abbreviation characters, derivates from Latin letters c, d, r, f and z. They represent the initials of the names of roots or powers. These characters are comparable to other already encoded abbreviation characters, like ℥ (libra, 2114), ™ (per, 214C), ℄ (denarius/penny, 20B0), ™ (prae-, A755) or ™ (-rum, A75D) which show a combination of a modified basic shape with some sort of graphic attachment, like scriptive loops directly connected to or crossing the base glyph.

We propose to encode the characters as *mathematical symbols*. In one case it has been worked out that a double encoding is required: one mathematical symbol character and one as a Latin letter character.

The aspect of case pairing is not relevant in all of the cases since no capital variants of these characters have ever been used anywhere. “Lowercase” in the proposed character names is chosen merely to indicate the proper respective ‘parent’ characters. The cossic characters do not occur as abbreviations in general Latin writing but exclusively in calculation contexts. Hence their specific shapes in combination with very specific meaning should justify their encoding, even if an apparent close optical ‘neighbourhood’ to existing characters can be observed. The proposed annotations will help to understand differences to and similarities with existing characters.

It is not necessary to encode all the characters in one place. If this proposal gets accepted, the following new characters will exist:

 LOWERCASE C WITH SMALL SLASH

= cubus

• denotes cube of the unknown

 LOWERCASE C WITH RIGHT LOOP

= cubus

• denotes cube of the unknown

 LOWERCASE C WITH DESCENDER

= census

• denotes square of the unknown

 LOWERCASE D ROTUNDA WITH CROSSING LOOP

= dragma

• denotes numerus / constant

→ 1E9F δ latin small letter delta

→ A77A δ latin small letter insular d

→ 20B0 ℄ german penny sign

 LOWERCASE R ROTUNDA WITH LOOP

= res, radix

• denotes the unknown

→ A75D z latin small letter r rotunda

→ A75D ™ latin small letter rum rotunda

→ A776 ™ latin letter small capital rum

→ 221A √ square root

ſ

LATIN SMALL LIGATURE LONG S WITH DESCENDER S xi06

= sursolidum

- denotes fifth power of the unknown in historical mathematics
- glyph always resembles long s and s
- corresponding mathematical symbol is [xi07]
- 017F ſ latin small letter long s
- 0073 s latin small letter s
- 00DF þ latin small letter sharp s
- A7D7 þ latin small letter middle scots s

ſ

MATHEMATICAL ITALIC LIGATURE LONG S WITH DESCENDER S xi07

= sursolidum

- denotes fifth power of the unknown in historical mathematics
- glyph always resembles long s and s
- in plain text the corresponding Latin letter [xi06] is preferred

ſ

LATIN SMALL LETTER LONG S WITH TOP LOOP

= sursolidum

- denotes fifth power of the unknown in historical mathematics
- 017F ſ latin small letter long s
- 1E9C ſ latin small letter long s with diagonal stroke
- 1E9D ſ latin small letter long s with high stroke
- xi06 latin small ligature long s with descender s

This character is proposed as a variation sequence:

ȝ

(LOWERCASE KURRENT Z) *variation sequence to U+1D4CF*

This variation sequence character would introduce a new category of variation sequences related to the Mathematical Alphanumeric (block 1D500) subgroup *Script symbols* (lowercase, 1D4B6 to 1D4CF). There has been a concern whether this single char. should justify such a new series of variation sequence characters. For to justify such a decision it may be considered that in our proposal L-2520 (N5335) another character of this kind is proposed:

ȝ LOWERCASE KURRENT X

This may well be regarded as a case of the same kind and dealt with in the same way.

Further examples of the use of other *kurrent style* small letters in mathematical notation can not be demonstrated at this point. It is, however, likely that more symbols of this kind may be testified in the future.

Group 2 is a set of three *root* or *radix* symbols, historically related to the  $\sqrt{}$  character (221A). The character names have now been defined according to the historic names in Stevin 1634 (see p. 18), in order to avoid a conflict with existing character names.

$\sqrt{\sqrt{}}$	SQUARE ROOT OF SQUARE ROOT → 221A $\sqrt{}$ square root
$\sqrt{\sqrt{\sqrt{}}}$	SQUARE ROOT OF SQUARE ROOT OF SQUARE ROOT → 221A $\sqrt{}$ square root
$\sqrt{\sqrt{\sqrt{\sqrt{}}}}$	SQUARE ROOT OF SQUARE ROOT OF SQUARE ROOT OF SQUARE ROOT → 221A $\sqrt{}$ square root

#### 4. The *cubus* characters

In group 1 there are two different characters for “cubus”:  $\mathfrak{c}$  and  $\mathfrak{C}$ . Although the meaning is the same, the representative glyphs differ considerably. These typographic differences are strongly tied to certain writing or publishing traditions. Therefore we propose to encode two characters, thus being in line with a principle which has been followed in e.g. the alchemical characters block, where also (in some cases) two or three different characters bear (basically) the same meaning. This character pair situation is also evident with some other characters of the cossic set.

#### 5. *Radix* characters

The LOWERCASE R ROTUNDA WITH LOOP  $\mathfrak{z}$  occurs frequently with the meaning of “res” or “radix”. The left part of the glyph is derived from the shape of the capital R, in a similar way as the left parts of the R ROTUNDA and RUM ROTUNDA characters (A75A to A75D) are derived from R. The distinctive feature of  $\mathfrak{z}$  is its right half with a prominent crossing loop moving down as a descender. In this form, the character unambiguously denotes the mathematical meaning in contrast to the syllabic meaning “-rum” of A75C/A75D as well as of A776.

But, as the sources show, the small capital R with stroke  $\mathfrak{r}$  (A776, LATIN SMALL CAPITAL RUM) has also been used eventually in the set of cossic characters. Therefore we also propose an addition of annotations to this character, as follows:

A776	$\mathfrak{r}$ LATIN LETTER SMALL CAPITAL RUM
	• cossic sign for res, radix
	→ A75D $\mathfrak{z}$ latin small letter rum rotunda
	→ [xxxx] $\mathfrak{z}$ lowercase r rotunda with loop

#### 6. *Sursolidum* characters

“Sursolidum” is also represented by two different characters:  $\mathfrak{f}$  and  $\mathfrak{f}'$ . This dual track situation has evolved historically by different local notation traditions. On the one hand, in an edition of historic sources it would not be tolerable to encode e.g.  $\mathfrak{f}$  (or even  $\mathfrak{f}$ , 00DF) instead of  $\mathfrak{f}'$ .

In recent discussions a variety of character names for  $\mathfrak{f}$  have been considered:

MATHEMATICAL ITALIC SHARP S  
SHARP S WITH HOOK  
MATHEMATICAL SHARP S  
SHARP S WITH DESCENDER

The background for a decision about the name has changed for two reasons: a) *two* characters are proposed now instead of one; b) a further evaluation has revealed that a definition containing the part ‘SHARP S’ would give a wrong interpretation of the character’s nature, identity and use. A detailed discussion of this matter is to be found in the appendix at the end of this document.

Following a suggestion made by A. Freytag, we propose the names:

- [xi06] LATIN SMALL LIGATURE LONG S WITH DESCENDER S
- [xi07] MATHEMATICAL ITALIC LIGATURE LONG S WITH DESCENDER S

By this naming we achieve:

- compliance with established UCS naming conventions
- a structural and historical correct explanation
- a clearly understandable definition of the characters nature
- correct naming of the character’s base characters
- to avoid confusion with the German ß (SHARP S)
- maintain the distinction between a plain-text character and a specific math character
- allow a different treatment of (xi07) and (xi06) in an Italic font, if there should be any need for that
- leave the door open for a possible later request for a *mathematical sharp s* (without a descender)

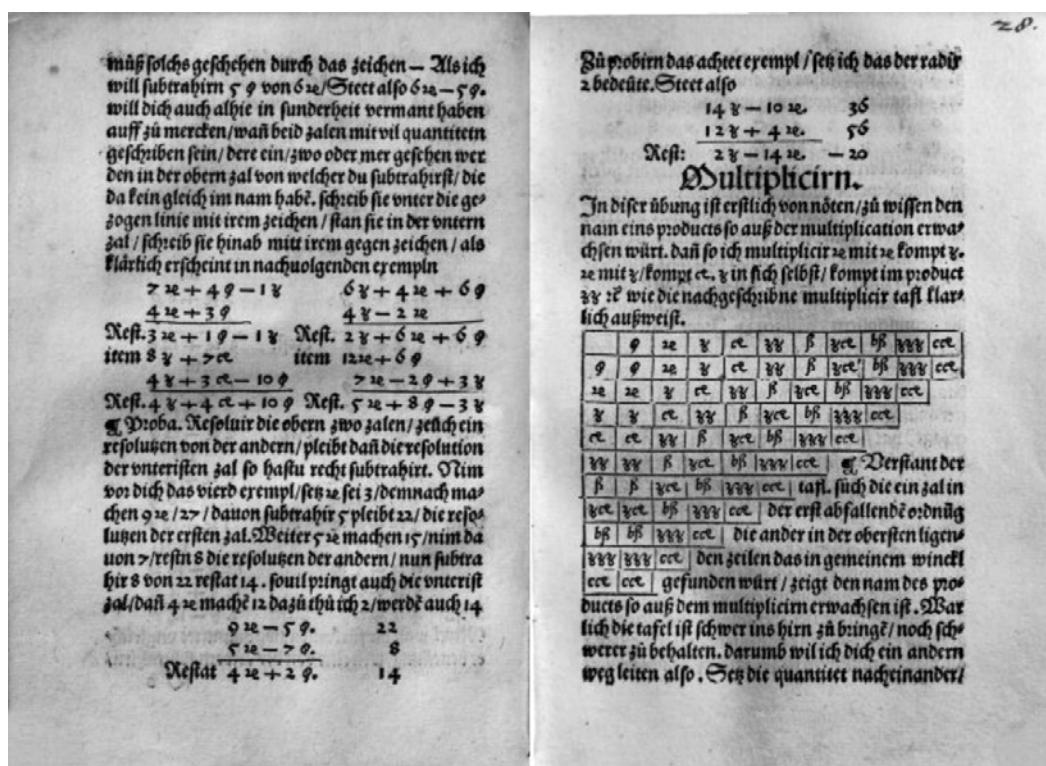

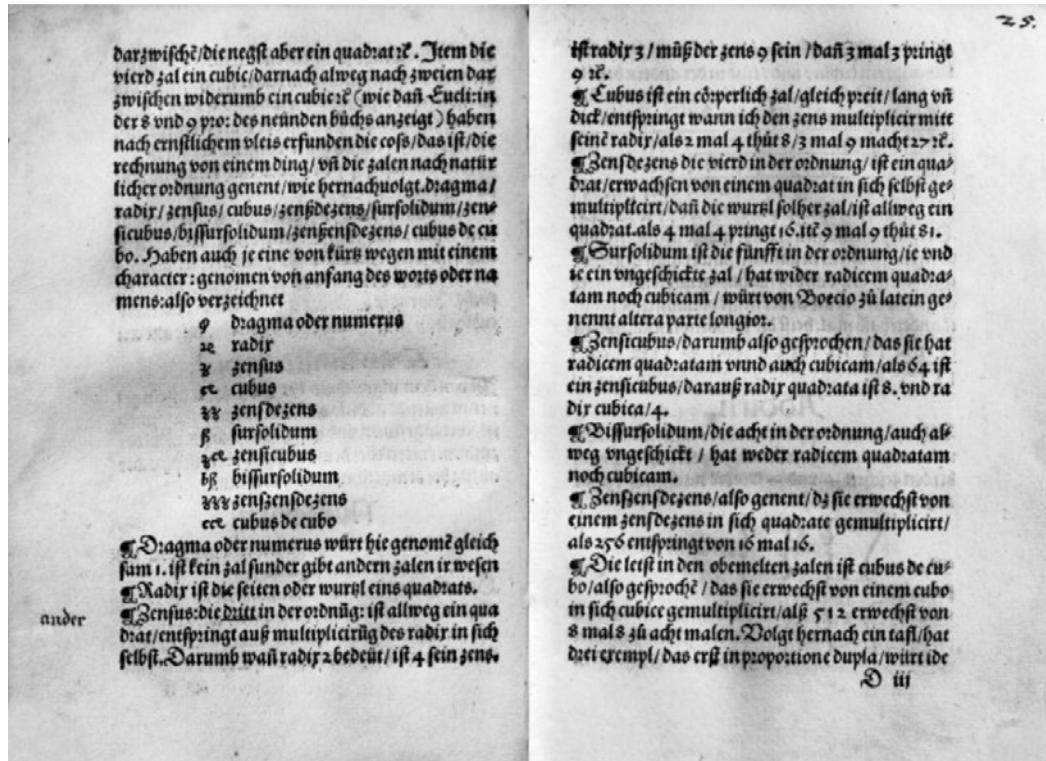

## 7. *Census characters*

There are also two different characters for “census/zensus”:  $\zeta$  and  $\zeta$ , related either to  $c$  or to  $z$ . We propose LOWERCASE KURRENT Z as a new variation sequence on U+1D4CF. Since  $\zeta$  and  $\zeta$  are derivates of two different base letters,  $\zeta$  is proposed separately.

## 8. Figures and further explanations

The *Coss* characters became a widely adopted set of characters for denoting powers and roots, in the 16th and 17th century. We show a couple of instances from printed sources and also a piece of manuscript evidence by Leibniz.

See page 19 for a synopsis of all characters belonging to the first group.

Christoff Rudolff: *Behend und hübsch Rechnung* ... Straßburg 1525, part of fol. 24v. In this chapter Rudolff introduces the set of root and power symbols by samples and explanations. We can see:  $\mathfrak{z}$  (LOWERCASE KURRENT Z),  $\mathfrak{d}$  LOWERCASE D ROTUNDA WITH CROSSING LOOP,  $\mathfrak{r}$  LOWERCASE R ROTUNDA WITH LOOP,  $\mathfrak{c}$  LOWERCASE C WITH RIGHT LOOP and  $\mathfrak{s}$  LATIN SMALL LIGATURE LONG S WITH DESCENDER S.

This print demonstrates the deliberate distinction between the cursive character  $\mathfrak{z}$  and the normal fraktur  $\mathfrak{z}$  (see at  $\mathfrak{z}, \mathfrak{z}, \mathfrak{z}, \mathfrak{z}$ ). Whereas in other scenarios these two shapes could be seen as ‘just’ glyph variants without semantic distinction, in this case the form difference is clearly an indicator for a specific meaning. The character  $\mathfrak{z}$  (LOWERCASE KURRENT Z) is denoting *zensus*. It is graphically characterized by a) a round-shaped upper part (mostly), and b) a prominent loop descender which crosses upwards. The origin of its shape is neither *Fraktur* type nor Latin script style but the German *Kurrent* writing style.

num semper sequitur 128. i. numerus zensizeniscus, qui uidelicet numerum quadratum habeat pro sua radice quadrata. Numerum zensizeniscum semper sequitur 13, id est, numerus surdesolidus. Numerum talem semper sequitur numerus zensicubicus, qui in cossica progressionē sic figuratur 13<sup>ce</sup>. Et sic deinceps in infinitum.

Hæc est igitur progressio cossica, ferens denominations numerorum cossicorum.

1. 128. 13. 128. 138. 13<sup>ce</sup>. 13<sup>β</sup>. 1388. 13<sup>ce</sup>. 138. 13<sup>β</sup>. 1388. 13<sup>ce</sup>. 138. 13<sup>β</sup>. 1388. 13<sup>ce</sup>. 138. 13<sup>β</sup>. 1388. Et sic deinceps in infinitum.

Nulla autem est progressio Geometrica, quam illa Cossica progressio comprehendat, cum nullus sit numerus qui non possit representari per 128. Et nullus sit numerus quadratus, qui non representetur sub isto termino eius 13. Atque nullus sit numerus cubicus, qui non comprehendetur sit hoc termino eius 13<sup>ce</sup>. Et sic de alijs.

Sicut autem denominations vulgares, non secundum unitates recipiunt, sed nullum excludunt; sic denominations illæ cossicæ, quoslibet numeros patiunt, ut 428. 103. 500<sup>ce</sup>. Et sic de alijs.

Dicuntur autem Cossici numeri, proportionaliter esse deno-

Stifel 1544 (after Cajori). This sample shows  $\gamma$  (LOWERCASE KURRENT Z),

 $\mathfrak{c}, \mathfrak{z}, \mathfrak{g}, \mathfrak{c}^0, \mathfrak{g} \mathfrak{g}, \beta, \mathfrak{g} \mathfrak{c}^0, b\beta, \mathfrak{g} \mathfrak{g} \mathfrak{g}, \mathfrak{c}^0 \mathfrak{c}^0, \mathfrak{g} \beta,$   
 $1, 2, 4, 8, 16, 32, 64, 128, 256, 512, 1024,$   
 $11, 12, 13, 14, 15, 16,$   
 $\mathfrak{c} \beta, \mathfrak{g} \mathfrak{g} \mathfrak{c}^0, d\beta, \mathfrak{g} b\beta, \mathfrak{c} \beta, \mathfrak{g} \mathfrak{g} \mathfrak{g},$   
 $2048, 4096, 8192, 16384, 32768, 65536.$

From Peletier 1620.

**C A P. XXVIII. 159**

Sit rursus Binomium primum  $72 + \sqrt{3} 280$ . Maius nomen  $72$ . secabitur in duas partes producentes  $720$ . quartam partem quadrati  $280$ . maioris nominis, hac ratione. Semislis maioris nominis  $72$ . est  $36$ . a cuius quadrato  $1296$ . detracta quarta pars predicta  $720$ . relinquit  $576$ . cuius radix  $24$ . addita ad semissem nominaram  $36$ . & detracta ab eadem, facit partes quasiferas  $60$ . &  $12$ . Ergo radix Binomij est  $\sqrt{3} 60 + \sqrt{3} 12$ , quod probatum est per multiplicationem radicis in se quadratè.

Sit quoque elicienda radix ex hoc residuo sexto  $\sqrt{3} 60 - \sqrt{3} 12$ . Maius nomen  $\sqrt{3} 60$ . distribuetur in duas partes producētes  $3$ . quartam partem quadrati  $12$ . minoris nominis, hoc pacto. Semislis maioris nominis  $\sqrt{3} 60$ . est  $\sqrt{3} 15$ . a cuius quadrato  $15$ . detracta nominata pars quarta  $3$ . relinquit  $12$ . cuius radix  $\sqrt{3} 12$ . addita ad semissem  $\sqrt{3} 15$ . predictam, & ab eadem sublata facit partes  $\sqrt{3} 15 + \sqrt{3} 12$ . &  $\sqrt{3} 15 - \sqrt{3} 12$ . Ergo radix dicti Residui sexti est  $\sqrt{3} (\sqrt{3} 15 + \sqrt{3} 12) - \sqrt{3} (\sqrt{3} 15 - \sqrt{3} 12)$  quod hic probatum est.

$$\frac{\sqrt{3} (\sqrt{3} 15 + \sqrt{3} 12) - \sqrt{3} (\sqrt{3} 15 - \sqrt{3} 12)}{\sqrt{3} (\sqrt{3} 15 + \sqrt{3} 12) - \sqrt{3} (\sqrt{3} 15 - \sqrt{3} 12)}$$

Quadrata partium.  $\sqrt{3} 15 + \sqrt{3} 12$  &  $\sqrt{3} 15 - \sqrt{3} 12$   
 $\quad - \sqrt{3} 3$   
 $\quad - \sqrt{3} 3$

Summa.  $\sqrt{3} 60 - \sqrt{3} 12$

Clavius 1608 (after Cajori):  $\mathfrak{z}$  (LOWERCASE KURRENT Z). In this setting of Roman type style the common z character will have the usual Greek-Latin 'Zeta' shape, z, whereas the symbol for *zensus* retains not only the z initial (in this Latin treatise one may expect *census* instead), but also the specific *kurrent* script form of the letter.

Nomina.		Characteres.

From Wallis, Operum mathematicorum, 1657 (after Cajori); shows the use of  $\sqrt[3]{}$  LOWERCASE LONG S WITH TOP LOOP for “sursolidum”.

The  $\sqrt[3]{}$  (LOWERCASE KURRENT Z) has been given a sort of ‘Latinization treatment’ here, based rather on the Greek/Roman zeta shape. We regard this as a glyph variant with no distinctive meaning.

Ternini: Alybrisici typus n. n. numero  
 apponens fabell.  $\frac{1}{2} + \frac{1}{2} 4$  per  $\frac{1}{2} 4 + \frac{1}{2}$   
 huc istis pacienti, qui sunt diversi genera, 3

 by faciem ex 10 pentagonis in his  
 numero  $\frac{1}{2} 3 + \frac{1}{2} 4$  quo est exponens  
 deus per  $\frac{1}{3} 4 + \frac{1}{3} 5$  fit  $\frac{1}{6} 8 + \frac{3}{6} 3 + \frac{2}{6} 4$

Ms. LH 4 I 4b 1v., Leibniz 1676, shows a frequent use of cossic signs:  $\mathfrak{c}$  LOWERCASE C WITH SMALL SLASH for *cubus*,  $\mathfrak{r}$  LOWERCASE R ROTUNDA WITH LOOP for *radix* and  $\mathfrak{z}$  (LOWERCASE KURRENT Z) for *zensus*.

The use of the simpler  $\mathfrak{c}$  instead of  $\mathfrak{C}$  for *cubus* is believed to originate from writings of Descartes, from who Leibniz (and other authors) made text copies.

## Multiplicirn.

Multiplicir einen cubic mit dem andern/ auf dem das do kommen würt ertrahir radicem cubicam/söb che radir zeige an das product so erwachsen ist aus multiplicirung einer cubic wurzl mit der andern. Zu exempl du sole .../ 27 multiplicieren mitt .../ 8 multiplicir 27 mit 8/ entspringt 216/ darauf radix cubica thut 6. Souil erwachst wäss ich .../ 27 multiplicir mit .../ 8

Exempl von communicanten  
.../ 54 mit .../ 16 facit .../ 864

Von iracionalm

.../ 6 mit .../ 4 facit .../ 24

Wann ein zal denominirt ist/ die ander nit/ so müß das absolut vorhin auch zu gleich denominirt werden. Geschicht also. multiplicir das absolut in sich selbst cubice/ seß vor das product disen character .../ darnach multiplicir ic. Als  
.../ 20 mit 2 Street also .../ 20 mitt .../ 8 fa: .../ 160  
12 mit .../ 5 street also .../ 128 mit .../ 5 fa: .../ 8640  
.../ 6 mit .../ 2 street also .../ 6 mit .../ 12 fa: .../ 93 1/2  
Auf dem würt verstanden das duplum in disem algorithmo ist mitt 8 multiplicirn. Triplum mitt 27. Quadruplum mit 64 multiplicirn/ vnd widerumb medijen durch 8 dividirn: c

## Dividirn.

Dividir eine cubic durch den andern/ radix cubica des

des quotients bericht dich wie off ein wurzl die ander in hält.

Exempl von rationaln.

.../ 64 durch .../ 8 fa: .../ 125 durch .../ 27 fa: .../ 27

Von communicanten

.../ 54 durch .../ 16 fa: .../ 16 - .../ 375 durch .../ 8 fa: .../ 27

Von iracionalm

.../ 27 durch .../ 9 facit .../ 3

Wann ein zal denominirt ist/ die ander nit/ so müß das absolut auch vorhin denominirt werden: wie du im multiplicirn verstanden hast. Als du wilt dividirn .../ 36 durch 3. Street also .../ 36 durch .../ 27 facit .../ 1 1/3. Item ich wil dividirn 6 durch .../ 4. Street also. .../ 216 durch .../ 4 facit .../ 54.

## Addirn.

Lernt zwei cubic wursln in ein summa pringē also. Besich/ sein die cubic zalen rational/ ertrahit die wursln/addir eine zur andern. Als .../ 8 zu .../ 64/ thut 6. Sein sie iracional/addir ein wurzl zur andern durch dz zeich +. Als .../ 6 zu .../ 12 facit .../ 12 + .../ 6. Sein sie aber communicanten/reducier sie in die kleinst proportion vns sie rational werde/ darnach addir ein wurzl zur andern/dz collect multiplicir in sich selbst cubice/den cub multiplicir weiter mit der gröst mensur dardurch die communicanten sein kleiner gemacht/radix cubica des letzten products/ zeige an die summa peider wursln. Als

g

Ein exempl von rationaln

.../ 16 zu .../ 8. Summa facit 5

Von iracionalm

.../ 18 zu .../ 25. Summa facit .../ 25 + .../ 18

Von communicanten

.../ 32 zu .../ 162. Summa facit .../ 1250

## Subtrahirn.

Besich/ sein die zensdezens rational. Extrahir die wursln vnd subtrahir die kleiner von der grössern. Sein sie iracional/ subtrahir durch das zeichen - Sein sie aber communicanten/ mach sie durch die reduction zu rationaln/ Subtrahir darnach ein wurzl von der andern/ Mit dem rest procedir gleich wie im addirn mit dem collect zähln gelemt hast/ so iiss gemacht

Ein exempl von rationaln

.../ 16 von .../ 625. Restant 3.

Von iracionalm

.../ 28 von .../ 36. Rest: .../ 36 - .../ 28 -

Von communicanten

.../ 32 von .../ 1250. Rest: .../ 162

## Multiplicirn.

Multiplicir eine zensdezens mit dem andern. Radir quadrata von radice quadrata solchs products/ ist dz/ so anß multiplicirung der wursln erwachsen thut. Zu exempl in rationaln. Ich wil multiplicirn

g iii

16200000000 facit 5451  
6000000000 facit 1817  
Nim dz kleiner vñ grössern. Rest: 3 63 4 aufseitell  
4800000000 Radix fa: 3 63 4  
Dergleichen probir auch die andern species.

**Das neund Capitl.**  
Lernt eine algorithnum zu latein genente surdis quadratorum de quadratis. Merck das quadratum de quadrato ist oben im fünfften capitl/ genent woz den zensdezens von solchen zalen ist der gegenwärtig algorithmus.  
Die wurzel oder radir von zensdezens würt alshie vermerkt durch solchen character.  
Als .../ 16 bedeutet radicis radicem/ das ist: radicem quadratam auf der gewirten wurzel von 16.  
Addirn  
Racional/ ertrahir die wursln. Addier eine zur andern  
Iracional/ Addier durch das zeichen +  
Communicanten/ Reducier sie in die kleinst proportion vns sie rational werde/ darnach thut ein wurzl zur andern. dz collect multiplicir in sich selbst quadrat/ das daraus kommt multiplicir auch quadrat. dz leicht quadrat gemultiplicirt mit der gemeinen mensur/ gibt eine zensdezens/ auf welchen ertrahir radicis radicem/ die leicht radix beschlaßt beide wursln der ersten zalen.

W FOURTH ROOT, W EIGHTH ROOT

Christoff Rudolff: Behend und hübsch Rechnung durch die kunstreichen regeln Algebre, so gemeinklich die Coss genennt werden. Straßburg 1525. fol. 38v-39r., 41v-42r

- ✓✓✓✓ (4) Racine de racine de quarte quantité, &c.

Le caractere signifiant la separation entre le si-

Simon Stevin, L'arithmétique in Œuvres mathématiques, 1634 (after Cajori)

The number of ascending lines indicates how often an operation of root determination is performed on an expression. In the Stevin example the combination with an encircled number indicates, which type of root is meant. If there is no such number, the square root is to be considered. For example, the combinations denote the following:

- ✓ square root of square root, which corresponds to the forth root;
- ✓✓ square root of square root of square root, which corresponds to the eighth root;
- ✓✓✓ square root of square root of square root of square root, which corresponds to the sixteenth root;
- ✓✓ (3) cubic root of cubic root, which corresponds to the ninth root;
- ✓✓✓ (4) forth root of forth root, which corresponds to the sixteenth root.

¶ Para tratar de tales numeros, y otros semejantes, seria cosa larga, y no galana, poner los tales nôbres a la larga: mas descendo huir esto, y cuitar toda prolixidad, procure poner aqui algunos, que para en esta arte eran necessarios. Y son ✓. ✓✓. ✓✓✓. ✓✓✓✓. ✓✓✓✓✓. Dclos quales el  $p^o$ , significa, y quiere dezir rayz quadrada: el  $2^o$ , rayz quadrada de rayz quadrada, o rayz de rayz: el  $3^o$ , rayz cubica: el  $4^o$ , rayz vniuersal: el  $5^o$ , rayz de rayz vniuersal: el  $6^o$ , rayz cubica vniuersal: el  $7^o$ , mas: y el  $8^o$ , menos. Exéplo, ✓ 4, quiere dezir rayz quadrada de 4, que es 2. ✓ 5, quiere dezir rayz de 5. &c. ✓ 20 + ✓✓ 7, quiere dezir, rayz de rayz de 20, y mas rayz cubica de 7. ✓ 8 - ✓ 3, quiere dezir, rayz quadrada de todo esto: q es 3 - ✓ 3.

- ✓ SQUARE ROOT OF SQUARE ROOT,
- ✓✓ SQUARE ROOT OF SQUARE ROOT OF SQUARE ROOT,
- ✓✓✓ SQUARE ROOT OF SQUARE ROOT OF SQUARE ROOT OF SQUARE ROOT.

Marco Aurel, Arithmetica algebratica, 1552 (after Cajori)

**ISO/IEC JTC 1/SC 2/WG 2**  
**PROPOSAL SUMMARY FORM TO ACCOMPANY SUBMISSIONS**  
**FOR ADDITIONS TO THE REPERTOIRE OF ISO/IEC 10646<sup>1</sup>**

Please fill all the sections A, B and C below.

Please read Principles and Procedures Document (P & P) from <http://std.dkuug.dk/JTC1/SC2/WG2/docs/principles.html> for guidelines and details before filling this form.

Please ensure you are using the latest Form from <http://std.dkuug.dk/JTC1/SC2/WG2/docs/summaryform.html>.  
See also <http://std.dkuug.dk/JTC1/SC2/WG2/docs/roadmaps.html> for latest Roadmaps.

**A. Administrative**

1. Title:	<b>Proposal to encode 12 cossic characters</b>	
2. Requester's name:	Uwe Mayer, Siegmund Probst, David Rabouin, Elisabeth Rinner, Andreas Stötzner, Achim Trunk, Charlotte Wahl	
3. Requester type (Member body/Liaison/Individual contribution):	Individual (work group)	
4. Submission date:	2025-09-30	
5. Requester's reference (if applicable):	LUCP L-2527	
6. Choose one of the following:	This is a complete proposal: <input checked="" type="checkbox"/> Yes (or) More information will be provided later: <input type="checkbox"/> Yes	

**B. Technical – General**

1. Choose one of the following:	a. This proposal is for a new script (set of characters): <input type="checkbox"/> No Proposed name of script: <input type="text"/>	
	b. The proposal is for addition of character(s) to an existing block: <input type="checkbox"/> Name of the existing block: <input type="text" value="not yet specified"/>	
2. Number of characters in proposal:	12	
3. Proposed category (select one from below - see section 2.2 of P&P document):	A-Contemporary <input type="checkbox"/> B.1-Specialized (small collection) <input checked="" type="checkbox"/> Yes <input type="checkbox"/> B.2-Specialized (large collection) <input type="checkbox"/> C-Major extinct <input type="checkbox"/> D-Attested extinct <input type="checkbox"/> E-Minor extinct <input type="checkbox"/> F-Archaic Hieroglyphic or Ideographic <input type="checkbox"/> G-Obscure or questionable usage symbols <input type="checkbox"/>	
4. Is a repertoire including character names provided?	a. If YES, are the names in accordance with the “character naming guidelines” in Annex L of P&P document? <input checked="" type="checkbox"/> Yes b. Are the character shapes attached in a legible form suitable for review? <input checked="" type="checkbox"/> Yes	
5. Fonts related:	a. Who will provide the appropriate computerized font to the Project Editor of 10646 for publishing the standard? <input type="text" value="Andreas Stötzner"/> b. Identify the party granting a license for use of the font by the editors (include address, e-mail, ftp-site, etc.): <input type="text" value="Andreas Stötzner Gestaltung, Klaufügelweg 21, 88400 Biberach/R., Germany, as@signographie.de"/>	
6. References:	a. Are references (to other character sets, dictionaries, descriptive texts etc.) provided? <input checked="" type="checkbox"/> Yes b. Are published examples of use (such as samples from newspapers, magazines, or other sources) of proposed characters attached? <input checked="" type="checkbox"/> Yes	
7. Special encoding issues:	Does the proposal address other aspects of character data processing (if applicable) such as input, presentation, sorting, searching, indexing, transliteration etc. (if yes please enclose information)? <input type="checkbox"/> No	

**8. Additional Information:**

Submitters are invited to provide any additional information about Properties of the proposed Character(s) or Script that will assist in correct understanding of and correct linguistic processing of the proposed character(s) or script. Examples of such properties are: Casing information, Numeric information, Currency information, Display behaviour information such as line breaks, widths etc., Combining behaviour, Spacing behaviour, Directional behaviour, Default Collation behaviour, relevance in Mark Up contexts, Compatibility equivalence and other Unicode normalization related information. See the Unicode standard at <http://www.unicode.org> for such information on other scripts. Also see Unicode Character Database (<http://www.unicode.org/reports/tr44/>) and associated Unicode Technical Reports for information needed for consideration by the Unicode Technical Committee for inclusion in the Unicode Standard.

<sup>1</sup> Form number: N4502-F (Original 1994-10-14; Revised 1995-01, 1995-04, 1996-04, 1996-08, 1999-03, 2001-05, 2001-09, 2003-11, 2005-01, 2005-09, 2005-10, 2007-03, 2008-05, 2009-11, 2011-03, 2012-01)

### C. Technical - Justification

1. Has this proposal for addition of character(s) been submitted before?	Yes
If YES explain <i>see L2/25-123 (L-2509); L-2518 (N5333)</i>	
2. Has contact been made to members of the user community (for example: National Body, user groups of the script or characters, other experts, etc.)?	Yes
If YES, with whom? Leibniz-Archiv, Forschungsstelle der Leibniz-Edition, Niedersächsische Landesbibliothek (GWLB), Hanover, Göttingen Academy of Science and Humanities in Lower Saxony (DE), Philiumm research group of CNRS (UMR 7219, laboratoire SPHERE) / Université de Paris VII; general: scholars, researchers, authors and editors working in the field of science history and upon editions of historic text corpora (e.g. of G. W. Leibniz, but also many others)	
If YES, available relevant documents: L-2409, L-2410	
3. Information on the user community for the proposed characters (for example: size, demographics, information technology use, or publishing use) is included?	Yes
Reference:	
4. The context of use for the proposed characters (type of use; common or rare)	Common
Reference: mainly specialist usage, scholarly, worldwide	
5. Are the proposed characters in current use by the user community?	Yes
If YES, where? Reference: mainly Europe, Americas; other countries	
6. After giving due considerations to the principles in the P&P document must the proposed characters be entirely in the BMP?	No
If YES, is a rationale provided?	
If YES, reference:	
7. Should the proposed characters be kept together in a contiguous range (rather than being scattered)?	No
8. Can any of the proposed characters be considered a presentation form of an existing character or character sequence?	No
If YES, is a rationale for its inclusion provided?	
If YES, reference:

And my notes regarding L2/25-123 (cossic characters):

- General consensus that sharp s with descender needs to be encoded as two characters:
  - LATIN LETTER SMALL SHARP S WITH DESCENDER
  - MATHEMATICAL ITALIC SMALL SHARP S WITH DESCENDER
  - in publications, this is shown in math zones as an italic math symbol, but otherwise (e.g. footnotes) as an upright character

I still have a problem with the naming "SHARP S", because it is incorrect and misleading. To the uninformed eye the char. gives the *impression* being 'some sort of B', but that is only accidental, hence of no meaning.

On the one hand, B (sharp s) is of **German** origin, its essence is a long f with some extension on the right side, which over time took on various shapes. To the day the form of that right part is not strictly defined, there are various legitimate options.

On the other hand, our new letter is *definitely* derived from **long f and s** and from nothing else. Its origin is **Latin**, its function is either an abbreviation (**fursolidum, femis**) or sometimes it can serve as a typographic ligature (**illistrifsimus**).

Therefore it is not appropriate to name the Latin f\_s character with the German term "sharp s". We would give a false information to generations to come.

We should define things properly and accurate. A naming decision should not be guided by accidental optical similarities which are (more or less) deceiving.

Would these names be acceptable:

- **LATIN LETTER SMALL SS WITH DESCENDER**
- **MATHEMATICAL ITALIC SMALL SS WITH DESCENDER**

that would be consistent with the scheme in names like LATIN SMALL LETTER NJ (01CC) or LATIN SMALL LETTER AE WITH MACRON (01E3).

with regards,  
Andreas Stötzner.

## Sursolidum: On character naming

I still have a problem with the naming “SHARP S”, because it is incorrect and misleading. To the uninformed eye the char. gives the *impression* being ‘some sort of B’, but that is only accidental, hence of no meaning.

Character names are tricky.

They serve two purposes. One is as a **human-readable identifier**. For that purpose, the name must be unique, and should be mnemonic. Beyond identifying a character, it should also help with selecting among similar characters.

For letters, we do this by basing a name on some more or less traditional name for that item in the alphabet. Which works well for that purpose, because letters, for the most part, are encoded by their identities as members of an alphabet, which sometimes allows a wider variety of shapes to be encoded by a single character: the selection of the actual shape is then not a matter of plain text, but also doesn't or shouldn't affect the meaning of the text as a whole.

However, once we go beyond base letters, composites or derivatives are named by modifying the name of the base letter plus a modifier or modifying phrase. Rotated, reversed, inverted, or “with ...” are common. This is done, even where some language, using these in their alphabet, may have a traditional name for that modified character.

For symbols, we often name them by function, particularly if that association is near universal, such as for radix (root) or integral. But often, we name the symbol by a description of its shape; that more easily accommodates multiple, unrelated uses of the symbol. But it also means that related symbols are named so that they end up with related descriptions (as much as possible). That detail of descriptive names helps in selecting the correct character for the intended symbol, independent of the font's glyph choice.

Symbols that aren't universally related to a single concept also don't necessarily have an agreed-upon range of permissible glyph shapes, unlike letters. Like with modified letters, descriptive names of derived symbols help focus on the distinguishing feature between the base shape and the derivative. They thus help reign in the range of acceptable glyph representations.

At the same time, names are neither exhaustive or perfect. The fact that we never change them, even if they are incorrect, means that we prioritize their uniqueness and stability over the other aspects and sometimes accept that names are primarily identifiers and do not always give an exhaustive or detailed description. The way we address this, most often, is by providing an annotation in the nameslist, either to provide an alternate informative name, or to indicate that an expanded or restricted range of glyptic variation is intended.

In this instance, there's a case to be made for noting the descender as a feature. But if we do that, then the other part of the name needs to be the name of a base form. That gets complicated if the base form is not itself a named character. However, as you notice, the existing letter can have representative glyphs that could be analyzed the way you indicate, but crucially also allows a number of different variations that matter to font designers but not to actual readers.

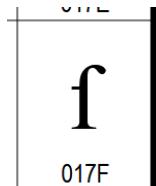

In this context, let's note that some of the submitted material substituted the sharp s for the *sursolidum*. This indicates that it would be useful to establish the relation between a form with descender and one of the

equivalent forms without a descender that is a valid subrange of the full glyph range for sharp s.

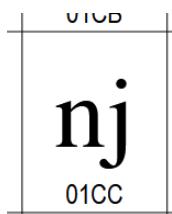

A fully descriptive name of the symbol used for *sursolidum* would be something like

- **LATIN SMALL LIGATURE LONG S WITH DESCENDER S**

The long s we encode in Unicode is clearly one without a descender.

and I would argue, if analyzed as a ligature, the descender is on the long s and not on the ligature. However, the shape of the character is most assuredly not a digraph of "ss". Compare the example you gave of

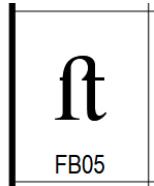

which clearly looks like "nj" and is not a ligature of "n" with "j". (Letter ae is an outlier, because it's a ligature treated as a named letter in an alphabet for some languages and there was a political compromise made to prioritize that over typographical naming which would have been more correct for other languages.)

To get back to the character at hand, a true digraph of long s and s would look like:

ſſ

with the forms not connected, quite unlike the *sursolidum*. If we want to treat this as a ligature, the closest analogy we have today is:

- **LATIN SMALL LIGATURE LONG S T**

For the SHARP S we have a range of glyphs, such as

ß ß ß ß ßß ßß

where the left most ones are from somewhat traditional type faces and the rightmost one is from a modern

mathematical font. For U+00DF, we explicitly note the two alternate forms as co-occurring with an annotation in the nameslist.

Based on all of the foregoing, I would be comfortable with continuing to use the **identifier** (name) of

- **MATHEMATICAL ITALIC SMALL SHARP S WITH DESCENDER**

together with an annotation, such as:

- if used for *sursolidum*, the form should be a ligature of a long s with descender and s.

Alternatively, we could suggest that the form with descender has a restricted glyph range:

- unlike U+00DF the form with descender is always a ligature with s

The same for the non-italic version. Plus cross references between and to U+00DF.

To me, this solution has several advantages:

1. We establish that, in the context of a mathematical font, this contrasts with U+00DF by addition of a descender. So that users know that when they need a form with descender to not use U+00DF.
2. We are also covered, in case there's a later request for a true mathematical italic sharp s with descender (true meaning that the letter sharp s is intended, not just the ligature shape).
3. If we get a request of a mathematical sharp s (without a descender) we are also covered, because we've set up the contrast correctly.
4. We head off encoding the distinction between an ss and sz version of these ligated forms by making clear that they are always unified in encoding and any glyph preference in a certain context needs to be specified outside plain text.

### Summary

We have a number of constraints on character names that we can't easily satisfy all at once in this case, partially because we are dealing with what essentially is a **letterlike symbol** or something that combines features of both letters and symbols. If this forces a compromise in naming, that's not the first time.

We also have overlapping glyph ranges and need to be careful whether we want to establish in the encoding that we are disunifying some glyph ranges in the encoding (even if only in the context of a derived shape), or whether we want to simply indicate that either the derived form or its use for a certain context have a restricted glyph range.

A./

PS: a more crucial question is whether we aren't making a mistaken identification here. The reason is that it can be argued that the "descender" on the β is a **feature of handwriting**, not something intrinsic to the letter. Here are some excerpts from early 20th century handwriting styles intended for elementary school instruction.

Both clearly show a descender on the β, even though they are using a different ligature. An interesting detail is that both were designed by the same person and the one on the right is of course *Sütterlin*.

The Wikipedia gives this shape for the β in its example of Kurrentschrift:

which is arguably an "s" shape with a connecting look, despite a claim to the contrary on the German Wikipedia, and not a "z". Note for comparison that "tz" looks like this in the same sample:

Given that as a background, we can ask ourselves if we should not simply encode a

- MATHEMATICAL SCRIPT SHARP S
- the form based on a ligature of long as and s is preferred

This would mean that the usage of some upright shape with descender in the footnotes would be erroneous. Any upright form should not have a descender (but for the purpose of designating *sursolidum* would have to use a font that is based on the long s s ligature).

---

Thanks to Asmus Freytag for the impressive contribution to this topic, which seems to me being a typical “three-whiskies-problem”...

Here some further thoughts upon it from my perspective.

| Asmus Freytag <[asmusf@ix.netcom.com](mailto:asmusf@ix.netcom.com)> hat am 01.05.2025 01:23 CEST geschrieben:

| Character names are tricky.

Given they are (in general), that would not free us from the task of making them as clear and fitting as possible.

I don't think character names are tricky. They need to be “made to measure” and be based on precise thinking.

| They serve two purposes. One is as a **human-readable identifier**. For that purpose, the name must be unique, and should be mnemonic. Beyond identifying a character, it should also help with selecting among similar characters.

Good point. The task of selecting is not served by a misleading name part. Moreover, even **because** there is a close visual similarity, it becomes **the more important** to mark the relevant difference(s), in order to make people understand those differences and enable them to make suitable decisions.

| For letters, we do this by basing a name on some more or less traditional name for that item in the alphabet. Which works well for that purpose, because letters, for the most part, are encoded by their identities as members of an alphabet, which sometimes allows a wider variety of shapes to be encoded by a single character:

| the selection of the actual shape is then not a matter of plain text, but also doesn't or shouldn't affect the meaning of the text as a whole.

Another good point. The *actual shape* is not what matters in the first place. What matters is **what is meant** by a shape. How a shape is to be understood. What is meant by the shape of the *fursolidum* character is: a ligation of f and s which (in most cases) serves as a stand-in or abbreviation for words like *fursolidum* or *femis*. The rationale of choosing “...sharp s...” here can only be justified by appearance of shape, a visual similarity with β. But that resemblance is merely accidental and therefore potentially misleading.

The modern β varieties which visually resemble long f and s are, at least in upright typography, a product of a misconception in the early 20th century. Whereas the *fursolidum* character is a child of the Renaissance period, hence ~500 years older. So it should be obvious that the *fursolidum* character just can't be a derivative of sharp s.

| However, once we go beyond base letters, composites or derivatives are named by modifying the name of the base letter

The *fursolidum* character is a composite or ligature, made of a long f and a round s, which are the base letters in this case. But that implies: the German β (sharp s) is **not** the base letter of it. The base letters which the char. derives from are f and s. Therefore it seems not appropriate to declare ‘sharp s’ in the characters name as the base letter. Unlike the very old German β which has several handed down, well-known names (of which ‘scharfes s’ is one of the most usual and, seen linguistically, the most suitable), the *fursolidum* character has no

inherited, popular name we could fall back to.

plus a modifier or modifying phrase. Rotated, reversed, inverted, or "with ..." are common. This is done, even where some language, using these in their alphabet, may have a traditional name for that modified character.

For symbols, we often name them by function, particularly if that association is near universal, such as for radix (root) or integral. But often, we name the symbol by a description of its shape; that more easily accommodates multiple, unrelated uses of the symbol.

But it also means that related symbols are named so that they end up with related descriptions (as much as possible).

The boundary between letters and symbols can not be drawn categorically. For instance, 211E and 211F (ꝑ, ꝑ) are basically **letters** with some graphic attachment, but they are widely **used as symbols** or (more precisely), as ideograms (graphic expression for a certain item or concept). It is a very similar situation with the *fursolidum* character.

That detail of descriptive names helps in selecting the correct character for the intended symbol, independent of the font's glyph choice.

– only if one can be sure that the descriptive name is 100% correct. Can we be sure? Example: 211E is named PRESCRIPTION TAKE. That is roughly OK as long as we are in Pharmacy matters (RECIPE would be less anglosaxon-centric but more appropriate because it is originally a Latin abbreviation for an R... word), but when we are in Mathematics it can mean "Radix" (rare), when we are in Numismatics it happens to stand for "Reverse" (side of a coin). So this char. would have been better off as LATIN CAPITAL R WITH CROSSBAR or similar. Because **that** description is **always** right.

Symbols that aren't universally related to a single concept also don't necessarily have an agreed-upon range of permissible glyph shapes, unlike letters.

The variability of acceptable glyph shapes depends on time and cultural environment, local customs, certain writing traditions and more. This is valid for letters and symbols alike and also for letters or letter derivates which function as abbreviations or symbols. The accepted variability usually doesn't overrun certain limitations, there's always a (more or less) limited *field* of possibilities. Again, I would not draw a sharp line between letters and symbols, generally.

Like with modified letters, descriptive names of derived symbols help focus on the distinguishing feature between the base shape and the derivative. They thus help reign in the range of acceptable glyph representations.

It could be said that in the case of the *fursolidum* character the descender of the base character f is a distinguishing feature, although it is a weak one because the ordinary long f can also feature a descender (– field of possibilities). However, the Latin *fursolidum* character is **definitely not** a derivative of the German ß. Although the sharp s is much older than the *fursolidum* abbreviation it is obvious that Latin authors (or French or Italian) had not a German ß in mind when they abbreviated *fursolidum* to f\_s. The base character of the *fursolidum* abbr. is long f.

At the same times, names are neither exhaustive or perfect.

Agreed. They don't have to. But they ought to be appropriate.

The fact that we never change them, even if they are incorrect, means that we prioritize their uniqueness and stability over the other aspects and sometimes accept that names are primarily identifiers and do not always give an exhaustive or detailed description. The way we address this, most often, is by providing an annotation in the nameslist, either to provide an alternate informative name, or to indicate that an expanded or restricted range of glyphic variation is intended.

A possible annotation to the character would be: • glyph should always resemble long f and s.

In this instance, there's a case to be made for noting the descender as a feature. But if we do that, then the other part of the name needs to be the name of a base form. That gets complicated if the base form is not itself a named character. However, as you notice, the existing letter can have representative glyphs that could be analyzed they way you indicate, but crucially also allows a number of different variations that matter to font designers but not to actual readers.

In this context, let's note that some of the submitted material substituted the sharp s for the *sursolidum*.

That is right, but, as we have explained, this phenomenon is to be seen just as a **makeshift** because of shortage of the proper letters in the composer's workshop; It occurs **only** in some German print works. In prints from other countries (e.g. Aurel/Valencia-1552, Peletier/Lyon-1554) the f\_s char. is used, it is also used in Rudolff/Straßburg-1525/first edition, and in Stifel/Nuremberg-1544. Therefore the usage of f\_s is the **relevant** usage, and the occasional use of ß is not actually relevant for the character's definition.

This indicates that it would be useful to establish the relation between a form with descender and one of the equivalent forms without a descender that is a valid subrange of the full glyph range for sharp s.

The permissible glyph shape range of ß is not relevant here.

A fully descriptive name of the symbol used for *sursolidum* would be something like

- **LATIN SMALL LIGATURE LONG S WITH DESCENDER S**

– that would be an agreeable definition.

The long s we encode in Unicode is clearly one without a descender.

The same counts for ß. But this is just because it is customary for modern Roman-style typefaces to have f and ß **without** descender. In fonts of other styles (e.g. script, chancery, Italic, Kurrent, blackletter, Fraktur...) f and ß frequently feature a descender because it is customary in those styles.

For that reason – f and ß **may have** a descender (as well) –, the feature of the descender is not what **in any case** makes the difference.

and I would argue, if analyzed as a ligature, the descender is on the long s and not on the ligature. However, the shape of the character is most assuredly not a digraph of "ss". Compare the example you gave of

– agreed, the part "ss" is not sufficiently unambiguous.

which clearly looks like "nj" and is not a ligature of "n" with "j". (Letter ae is an outlier, because it's a ligature treated as a named letter in an alphabet for some languages and there was a political compromise made to prioritize that over typographical naming which would have been more correct for other languages.)

To get back to the character at hand, a true digraph of long s and s would look like:

with the forms not connected, quite unlike the *sursolidum*. If we want to treat this as a ligature, the closest analogy we have today is:

- **LATIN SMALL LIGATURE LONG S T**

For the SHARP S we have a range of glyphs, such as

where the left most ones are from somewhat traditional type faces and the rightmost one is from a modern mathematical font. For U+00DF, we explicitly note the two alternate forms as co-occurring with an annotation in the nameslist.

Based on all of the foregoing, I would be comfortable with continuing to use the **identifier** (name) of

- **MATHEMATICAL ITALIC SMALL SHARP S WITH DESCENDER**

together with an annotation, such as:

- if used for *sursolidum*, the form should be a ligature of a long s with descender and s.

Alternatively, we could suggest that the form with descender has a restricted glyph range:

- unlike U+00DF the form with descender is always a ligature with s

The same for the non-italic version. Plus cross references between and to U+00DF.

To me, this solution has several advantages:

1. We establish that, in the context of a mathematical font, this contrasts with U+00DF by addition of a descender. So that users know that when the need a form with descender to not use U+00DF.
2. We are also covered, in case there's a later request for a true mathematical italic sharp s with descender (true meaning that the letter sharp s is intended, not just the ligature shape).
3. If we get a request of a mathematical sharp s (without a descender) we are also covered, because we've set up the contrast correctly.
4. We head off encoding the distinction between an ss and sz version of these ligated forms by making clear that they are always unified in encoding and any glyph preference in a certain context needs to be specified outside plain text.

### Summary

We have a number of constraints on character names that we can't easily satisfy all at once in this case, partially because we are dealing with what essentially is a **letterlike symbol** or something that combines features of both letters and symbols. If this forces a compromise in naming, that's not the first time.

We also have overlapping glyph ranges and need to be careful whether we want to establish in the encoding that we are disunifying some glyph ranges in the encoding (even if only in the context of a derived shape), or whether we want to simply indicate that either the derived form or its use for a certain context have a restricted glyph range.

A./

[ ... ]

Given that as a background, we can ask ourselves if we should not simply encode a

- MATHEMATICAL SCRIPT SHARP S

– rather not.

- the form based on a ligature of long as and s is preferred

This would mean that the usage of some upright shape with descender in the footnotes would be erroneous. Any upright form should not have a descender (but for the purpose of designating *sursolidum* would have to use a font that is based on the long s s ligature).

I propose the following solution:

(1)

#### LATIN SMALL LIGATURE LONG S WITH DESCENDER S

= *sursolidum*

- glyph always resembles long s and s

(2)

#### MATHEMATICAL ITALIC LIGATURE LONG S WITH DESCENDER S

= *sursolidum*

- glyph always resembles long s and s
- corresponding text character is (1) *[optional]*

With this we achieve:

- compliance with practised naming conventions
- a structural and historical correct explanation
- a clearly understandable definition of the characters nature
- to avoid confusion of the Latin abbreviation character with the German ß
- allow (1) to be implemented in both a typeface's Regular and Italic fonts with appropriate shapes
- maintain a safe distinction between a plain-text character and a specific math character
- allow a different treatment of (1) and (2) in an Italic font, if there should be any need for that
- leave the door open for a possible later request for a *mathematical sharp s* (without a descender)

---
