Working Group Document
Review of Revised Proposal to Encode Jurchen (N3788)
Andrew West
Individual Contribution
For consideration by JTC1/SC2/WG2 and UTC
2010-04-15

1. Character Names

A. Errors in the Source Dictionary

The following corrections of errors in the phonetic transcriptions in the source dictionary should be reflected in the character names:

- 012-02 X-0051 百(湯古) tanygu should be taygu
- 021-05 X-0108 育 (湯古) tanygu should be taygu
- 023-01 X-0114 孟 (希兒) çïr should be çir

- 084-07 X-0405 引 (問) giyen should be gijen
- 138-02 X-0639 章 (謙) fien should be teien
- 169-03 X-0771 美 futici? should be fuffiçi
- 178-02a X-0810a *夹 futici*? should be *futfiçi*
- 207-01 X-0952 任 (只速) 皮isu should be 皮isu

B. Simplification of the Phonetic Transcription

The phonetic reconstructions used in the source dictionary are strictly phonetic, and so use different phonetic symbols to represent the same phoneme in different contexts.

The following phonetic symbols only occur before back and mid vowels:

- \int before $a, o, u, \partial, \ddot{i}$
- f before $a, o, u, \partial, \ddot{i}$
- dz before $a, o, u, \partial, \ddot{i}$
- *3* before *u*

Whereas the following corresponding phonetic symbols only occur before front vowels:

- *ç* before *i*, *y*
- *tc* before *i*
- *dz* before *i*, *y*

The vowels e and ϑ are also in complementary distribution:

- e only occurs as ei, ie and je
- ∂ never occurs before/after *i* or after *j*

We believe that there is no need to preserve such non-phonemic distinctions in the character names, and suggest representing pairs of phonetic symbols that represent the same phoneme and that are in complementary distribution (i.e. f/c, f/tc, dz/dz and e/∂) using the same ASCII letter or letters, for example using 'E' for both e and ∂ .

C. Use of Accented Letters in Character Names

The character names proposed in N3788 include extended characters (e.g. Ś, Š, Ź, Ž, È), which are disallowed according to the character naming rules. We propose the following scheme for translating the phonetic transcription in the source dictionary to legal character names (all unlisted characters are unchanged):

- $e/\partial = E$
- $\varepsilon = AE$
- $\eta = NG$
- dz/dz = J
- tc/tf = C
- c/f = SH
- 3 = ZH
- j = Y (in complementary distribution with 'Y' representing the vowel [y])

We prefer "J" and "C" to "DZH" and "TSH" as Manchu romanization uses "j" and "c", so the resultant Jurchen names appear much closer to their Manchu cognates.

2. Wrongly Ordered Characters

The following characters appear to be misordered:

- X-0663b (Radical 7 / 4 strokes) should be moved to after X-0218
- X-0894a (Radical 32 / 6 strokes) should be moved to after X-0931d
- X-0454 (Radical 22 / 8 strokes) and X-0455 (Radical 21 / 8 strokes) should be swapped
- X-0993 (214-08) and X-0994 (214-09) should be swapped

3. Duplicate Characters

N3788 proposes encoding the character in entry 048-03 (X-0231a and X-0231b) twice as it is a variant form of two different characters (048-02 and 051-01). We believe that this character should not be encoded twice.

4. Radical 21

The glyph form of Radical 21 ++ does not exactly match the shape of the radical in the characters under radical 21. The radical glyph has crossing horizontal strokes, whereas the characters under this radical do not:

We believe that although the difference is minor, it would be best to change the glyph for Radical 21 to match its actual appearance so that it is more distinct from Radical 20:

5. Glyph Variants

The revised proposal (N3788) proposes 1,430 characters for encoding, of which:

- 523 characters have no variant forms (including nearly a hundred characters with unknown readings that may in fact be variants of other characters proposed for encoding)
- 368 characters are the primary form of a character with multiple glyph variants
- 539 characters are glyph variants

Thus, almost 40% of the proposed Jurchen characters are glyph variants, which is a considerably higher proportion than for any other script encoded or proposed for encoding in the UCS. Moreover, very many of the glyph variants proposed for encoding show very insignificant differences, often just reflecting a slightly different way of writing the same stroke in different manuscript sources, as for example:

BIRA	倚倚
BUXA	云云
CII	更秉
CUEN	仔仔
DAI	米米
ESE	乞攴
FUN	买买
GE	秀方
FI	米米
FO	玫玫
GE	层层
GU	鱼鱼
Ι	于于
INDA	库库
IU	外 孙
JAL	危尼
JO	
JU	盂 击
KI	其共
MA	元冗
MI	乗乗
MINGGAN	五五
МО	毛 元
MUA	呆呆

It may be appropriate to separately encode some significant character variants, but it may be more appropriate to represent insignificant glyph variants by means of variation sequences.

In several respects, the nature of the Jurchen character variants is significantly different to that of Tangut character variants, which means that although variation sequences are not appropriate in the case of Tangut, they may be the most appropriate solution for Jurchen:

Tangut	Jurchen
Relatively few variant characters (about 120 out of the 6,054 characters proposed for the main Tangut block)	Relatively many variant characters (539 out of 1,430 proposed characters)
Most variants are attested in more	Most variants are only used in Jin
than one modern Tangut dictionary	Qicong's dictionary
Most Tangut variants are	Most Jurchen variants are
distinguished by a different	distinguished only by a different way
structural composition (one or more	of writing the same stroke (e.g. the
different component elements, or the	angle or length of a stroke) or a
same component elements arranged	different placement of a stroke or a
differently)	difference in stroke count
