

Title: Preliminary Code Chart for the Pau Cin Hau Syllabary
Source: Script Encoding Initiative (SEI)
Author: Anshuman Pandey (pandey@umich.edu)
Status: Liaison Contribution
Action: For consideration by WG2 and UTC
Date: 2013-04-15

1 Introduction

This document presents a preliminary code chart for the ‘Pau Cin Hau Syllabary’ (previously ‘Pau Cin Hau Logographs’). The block is tentatively allocated to the range U+14000 .. U+143FF in the Roadmap to the Supplementary Multilingual Plane (SMP). The code chart supplements information in “Introducing the Logographic Script of Pau Cin Hau” (N3961 L2/10-438). It is to be used for informational purposes only.

The code chart contains 1,061 characters. This repertoire consists of 1,050 syllables (U+1400A .. U+14424), 10 digits (U+14000 .. U+14009), and 1 symbol (U+14425). The 1,050 syllables appear in a Laipian recitation text written in the Tedim language by Pau Cin Hau. The Laipian tradition holds that the text contains all characters of the syllabary. The characters are also enumerated in a Tedim dictionary; however the number of distinctive, named characters given in this source is 923 (see N3961 L2/10-438). The difference between the two repertoires is the inclusion of characters in the set of 1,050 that are combinations of a base syllable and a combining mark. These marks are used for indicating tone, vowel length, glottal stop, or final consonant.

The glyphs for syllables and digits are sourced from the recitation text and the glyph for the symbol is taken from a book cover and a photograph of a signboard; the font was developed by the present author. Characters for the syllables are tentatively assigned numerical names based upon their serial order in the recitation text. The names will be changed to the Latin transcription of the syllables when this information is available.

The next step in developing an encoding for the Pau Cin Hau Syllabary is to establish the repertoire of distinctive characters. This requires a comparison of the characters in the recitation text and the dictionary in order to distinguish atomic characters from those that are a combination of a base syllable and a combining mark. Based upon the repertoire given in the dictionary, there are at least 127 characters in the recitation text that represent such combinations. Research is also required for determining if there are attested characters that do not appear in either the recitation text or in the dictionary. Progress is slow on account of difficulty in establishing remote correspondence with the user community in Chin State, Myanmar.

2 Acknowledgments

This project was made possible in part with support from the Script Encoding Initiative at the University of California, Berkeley. I would like to thank Christopher Button for providing a copy of the recitation text.
