pandey@umich.edu

January 22, 2014

1 Introduction

This is a proposal to encode the Zanabazar Square script in the Universal Character Set (ISO/IEC 10646). It supersedes the following documents:

- N3956 L2/10-411 “Preliminary Proposal to Encode the Xawtaa Dorboljin Script in ISO/IEC 10646”
- N4041 L2/11-162 “Preliminary Proposal to Encode the Mongolian Square Script in ISO/IEC 10646”
- N4160 L2/11-379 “Revised Preliminary Proposal to Encode the Mongolian Square Script”
- N4413 L2/13-068 “Proposal to Encode the Mongolian Square Script in ISO/IEC 10646”
- N4471 L2/13-198 “Revised Proposal to Encode the Mongolian Square Script in ISO/IEC 10646”

The ‘Zanabazar Square script was previously referred to as the ‘Mongolian Square script’ (see section 3.1). Other changes introduced after N4471 L2/13-198 include: the replacement of the generic ‘subjoiner’ with a virama character for representing conjunct stacks (see sections 4.8 and 4.10); new names for several characters (see section 3.3); new head marks and ornaments (see section 4.11); the reordering of characters within the block; and the reallocation of the script block to a new range within the Supplementary Multilingual Plane (SMP). These changes are based upon feedback from experts.

The Zanabazar Square font used here is based upon the font developed by Oliver Corff in November 2001 for his “Xäwtää Dörböljin for L propósito” package. The proposal author has made several modifications to Corff’s original font, including changes to the original glyphs and the addition of new glyphs.

2 Background

The Zanabazar Square Script is a syllabic alphabet based upon Tibetan and inspired by the Brahmi model. It was used for writing Mongolian, Sanskrit, and Tibetan. The script was invented by Zanabazar (1635–1723), one of the most important Buddhist leaders in Mongolia, who also developed the Soyombo script. The precise date is unknown, but it is believed that its creation preceded that of Soyombo. Named after its creator, the Zanabazar Square script bears similarities to Tibetan and Phags-pa (see tables 7–9). It is actively studied
Proposal to Encode the Zanabazar Square Script in ISO/IEC 10646

by scholars and academic works on the script continue to be published (see Shagdarsüürüng (2001); Ragchaa (2005); Bareja-Starzyńska and Ragchaa (2012)).

3 Proposal Details

3.1 Script Name

The name for the script block is ‘Zanabazar Square’. It is known in Mongolian as ‘Хэвтээ Дөрвөлжин бичиг’ xewtee dörböljin bicig or ‘Хэвтээ ДөрвөлжинҮсэг’ xewtee dörböljin üseg, both of which translate into English as “Horizontal Square Script”, but this is a technical name and is not commonly used. The name normalized Latin transliteration ‘Xewtee Dorboljin’ was used for the script in the preliminary proposal, but it was deemed too localized for usage in an international context. Therefore, the descriptor ‘Mongolian’ was added to the English translation to produce ‘Mongolian Horizontal Square’. However, this name proved a bit long and it was curtailed to ‘Mongolian Square’. Yet, ‘Mongolian Square’ is a generic name as it can also refer to Phags-pa, another Mongolian, or rather Central Asian, script that is also known as ‘ДөрвөлжинҮсэг’ dörböljin üseg, or ‘Square Script’.

The script is commonly refered to as ‘Занабазарын ДөрвөлжинҮсэг’ zanabazarin dörböljin üseg “Zanabazar Square Script” in the academic community (see Byambaa Ragchaagiin 2005). This name is used because it differentiates the two Central Asian ‘square’ scripts on the basis of the names of their inventors: ‘Phags-pa’ for the vertical and ‘Zanabazar’ for the horizontal script. For these reasons, ‘Zanabazar Square’ is a suitable and unique identifier for the script block in the UCS. The Mongolian and alternate English names have been added as aliases for the script in the names list.

3.2 Character Repertoire

The Zanabazar Square block contains 69 characters. A code chart and names list are attached. The proposed repertoire contains elements that are not enumerated as separate characters in traditional arrangements of Zanabazar Square and in secondary sources. In some cases, the repertoire treats textual elements as sequences of characters instead of as atomic characters. For example, vowels such as 𑨀𑨂𑨢 ā, 𑨄𑨂 i, 𑨅𑨂 ī, etc. are enumerated as independent characters in traditional charts, but they are to be represented in encoded text as combinations of a base letter and combining vowel sign. Mongolian syllable-final consonants such as 𑨀𑨂𑨢 ag, 𑨄𑨂 ang, etc. are also treated similarly. Redundant elements have been eliminated, such as the occurrence of 𑨀𑨂𑨢 ā among both the vowels and codas, as well as the two instances of 𑨃𑨂 ba / va. These details are explained in section 4.7.1. The deviation from traditional perspectives regarding Zanabazar Square, or any other script, is a necessity for developing a character-encoding standard for the script in the UCS.

3.3 Character Names

An attempt has been made to align names for Zanabazar Square characters with those in the Tibetan block of the UCS. The names also correspond to characters of the Phags-pa block and those of the proposed encoding for Soyombo (see N4414 L2/13-069). The names also align with transliterated values given for Zanabazar Square characters in secondary sources, such as Tseveliin Shagdarsüürüng (2001) and Byambaa Ragchaagiin (2005), which have been normalized according to UCS naming conventions. In this proposal, names for proposed characters are given in small capitals and transliterated values in italics, eg. the character 𑨂 is referred to as ka and its transliterated values as Sanskrit / Tibetan ka and Mongolian ga (see section 4.7.3 for language-specific transliteration).
In previous versions of this proposal the names for consonant letters were based upon Mongolian sound values as given in the available secondary sources. However, the majority of these sources are Mongolian texts, which provide an analysis of the script from a Mongolian perspective. While this perspective is certainly valid, it does not provide distinctive values for all characters. For instance, in Mongolian sources Ԑ is transliterated as ga and is used for writing Mongolian g and γ, as well as Sanskrit and Tibetan ka; however, Ԑ is also named ga, but this letter is used only in Sanskrit and Tibetan contexts. In order to accommodate this perspective, in previous versions of the proposal, letters used specifically for Tibetan and Sanskrit were distinguished using the descriptor ‘galig’ (Mongolian: гали), a term applied to letters used for the transcription of non-Mongolian sounds. As a result, Ԑ and Ԑ were named Ga and Galig Ga, respectively. However, as the Zanabazar Square script is based upon the Tibetan script and is intended for representing Mongolian as well as Sanskrit and Tibetan, the Mongolian analysis is somewhat limiting. Based upon feedback from experts such as Agata Bareja-Starzyńska and Andrew West, the names for Zanabazar Square consonants are now aligned with those of Tibetan. This approach removes the need to use the descriptor ‘galig’ and provides consonant letters with distinctive names that index their values according to the Tibetan model.

3.4 Encoding Order

The encoding order follows the pattern of the Tibetan block in the UCS. This order differs from that given in previous versions of the proposal, which was based upon the traditional Mongolian arrangement of the script. The Tibetan order is preferred because, as the script is modeled upon Tibetan, it offers a more natural order for the letters. In the Mongolian ordering system, ‘galig’ letters representing voiced and aspirated consonants were separated from their unvoiced and unaspirated counterparts. The new order provides for contiguous placement of related characters. Moreover, there are four letters (Ԑ Ca, Ԑ Cha, Ԑ Ja, Ԑ SSA) that are not found in traditional charts of the script, so it is unclear where they should be placed in an encoding order based upon the traditional arrangement. The Tibetan order provides a method of accommodating these characters. Moreover, basing the encoding order of Zanabazar Square with that of Tibetan in the UCS will facilitate aligned encodings for these related scripts.

4 Script Details

4.1 Structure

The Zanabazar Square script is written from left to right. As indicated by its Mongolian name, xewtee dörböljin bicig, the script is written horizontally, but in some instances occurs in vertical environments.

Independent vowels are written using a vowel-carrier letter to which vowel signs are attached. Vowel length is indicated by a sign that is attached to a base letter or to a combination of a base letter and one or more dependent vowel signs.

Consonant letters possess the inherent vowel a. The phonetic value of a consonant letter is changed by the attachment of a vowel sign. In Mongolian contexts, the inherent vowel is suppressed by a final-consonant mark, which indicates both a syllable-final consonant and a syllabic boundary. In Sanskrit and Tibetan contexts, the inherent vowel of a consonant is silenced using the virama. There are no consonant clusters in Mongolian, but those of Sanskrit and Tibetan are rendered as conjuncts. Similar to other scripts in the UCS that are based upon the Brahmī model, a sequence of bare consonants marked by virama forms a cluster, which is represented as a conjunct and rendered as a vertical stack with non-initial letters placed beneath the initial letter. The consonants Ya, Ra, La, Va have different representations when they occur in Sanskrit and Tibetan conjuncts, therefore, contextual forms of these letters are provided as separate characters in order to facilitate the encoding model.
The graphical structure of a Zanabazar Square vowel syllable may be described as

LETTER A [vowel sign]* [vowel length mark] [CANDRABINDU | ANUSVARA] [VISARGA]

A consonantal syllable may be described as follows:

[cluster-initial letter] consonant [cluster-final letter* [consonant* cluster-final letter*]] [vowel sign]* [vowel length mark] [CANDRABINDU | ANUSVARA] [VISARGA]

where there is one base consonant, which may occur in a conjunct with several other consonants. The sources show conjuncts containing at least three consonants, but theoretically the number may be greater. One or more vowel signs may be used with a base consonant or conjunct. The vowel-length mark may attach to a consonant or vowel sign. One of either the CANDRABINDU or ANUSVARA may occur with a consonant or vowel sign. The VISARGA may follow last and can attach to a consonant, vowel sign, or the vowel-length mark.

4.2 Vowel Letter

The ੵ LETTER A represents the vowel a and a zero vowel depending upon phonotactical conditions. When it occurs independently it has the value a. When a vowel sign is attached to it, the LETTER A is a zero vowel and assumes the value of the vowel sign.

4.3 Vowel Length Mark

A long vowel is represented by placing the 事业发展 VOCALLENGTH MARK after a consonant or vowel sign. When combined with the letter ੵ A or a consonant letter it represents the lengthening of the inherent vowel a to ā.

4.4 Vowel Signs

There are 9 dependent vowel signs:

- ੵ VOWEL SIGN I
- ੺ VOWEL SIGN O
- ੻ VOWEL SIGN UE
- ੼ VOWEL SIGN U
- ੽ VOWEL SIGN E
- ੺ VOWEL SIGN OE
- ੺ VOWEL SIGN O
- ੻ VOWEL SIGN AI
- ੽ VOWEL SIGN AU

The signs are written with base letters, ie. ੵ A and consonants. Multiple vowel signs may combine with a single base letter. Independent vowels are represented by attaching vowel signs to the carrier ੵ LETTER A. The independent forms of ੵ VOWEL SIGN REVERSED I are written according to a different pattern.

The first 8 vowel signs, in conjunction with the VOCALLENGTH MARK, are used for writing the basic 16 vowels given in traditional script charts:

\[
\begin{align*}
\text{a} & \quad \text{ਅ} \quad <\text{ਅ LETTER A}> \\
\text{ā} & \quad \text{ਅ} \quad <\text{ਅ LETTER A}, \ 事业发展 VOCALLENGTH MARK>
\end{align*}
\]
4.4.1 Diphthongs

The signs ‘Vowel sign ai’ and ‘Vowel sign au’ represent the diphthongs ai and au, respectively. They also function as secondary vowel signs for i and u for producing additional diphthongs for Mongolian (see figures 43–45). These diphthongs are represented using combinations of signs:

\[
\begin{align*}
\text{i} &
\quad <\text{U LETTER A}, \text{Vowel sign i}> \\
\text{i} &
\quad <\text{U LETTER A}, \text{Vowel sign i}, \text{Vowel length mark}> \\
\text{u} &
\quad <\text{U LETTER A}, \text{Vowel sign u}> \\
\text{u} &
\quad <\text{U LETTER A}, \text{Vowel sign u}, \text{Vowel length mark}> \\
\text{e} &
\quad <\text{U LETTER A}, \text{Vowel sign e}> \\
\text{e} &
\quad <\text{U LETTER A}, \text{Vowel sign e}, \text{Vowel length mark}> \\
\text{ê} &
\quad <\text{U LETTER A}, \text{Vowel sign e'}} \\
\text{o} &
\quad <\text{U LETTER A}, \text{Vowel sign o}> \\
\text{o} &
\quad <\text{U LETTER A}, \text{Vowel sign o}, \text{Vowel length mark}> \\
\text{ai} &
\quad <\text{U LETTER A}, \text{Vowel sign ai}> \\
\text{au} &
\quad <\text{U LETTER A}, \text{Vowel sign au}>
\end{align*}
\]

\[
\begin{align*}
\text{āi} &
\quad <\text{U LETTER A}, \text{Vowel length mark}, \text{Vowel sign ai}> \\
\text{ii} &
\quad <\text{U LETTER A}, \text{Vowel sign i}, \text{Vowel sign ai}> \\
\text{iu} &
\quad <\text{U LETTER A}, \text{Vowel sign i}, \text{Vowel sign au}> \\
\text{ii} &
\quad <\text{U LETTER A}, \text{Vowel sign i}, \text{Vowel sign ai}, \text{Vowel length mark}> \\
\text{ii} &
\quad <\text{U LETTER A}, \text{Vowel sign i}, \text{Vowel sign ai}, \text{Vowel length mark}, \text{Vowel sign au}> \\
\text{ei} &
\quad <\text{U LETTER A}, \text{Vowel sign e}, \text{Vowel sign ai}> \\
\text{ēi} &
\quad <\text{U LETTER A}, \text{Vowel sign e}, \text{Vowel sign ai}, \text{Vowel length mark}> \\
\text{ēi} &
\quad <\text{U LETTER A}, \text{Vowel sign e}, \text{Vowel sign ai}, \text{Vowel length mark}, \text{Vowel sign au}> \\
\text{ei} &
\quad <\text{U LETTER A}, \text{Vowel sign e}, \text{Vowel sign ai}, \text{Vowel length mark}, \text{Vowel sign au}, \text{Vowel sign e}> \\
\text{ó} &
\quad <\text{U LETTER A}, \text{Vowel sign o}, \text{Vowel length mark}> \\
\text{ū} &
\quad <\text{U LETTER A}, \text{Vowel sign u}, \text{Vowel length mark}> \\
\text{û} &
\quad <\text{U LETTER A}, \text{Vowel sign u}, \text{Vowel length mark}, \text{Vowel sign au}> \\
\text{ō} &
\quad <\text{U LETTER A}, \text{Vowel sign o}, \text{Vowel length mark}> \\
\text{û} &
\quad <\text{U LETTER A}, \text{Vowel sign u}, \text{Vowel length mark}, \text{Vowel sign au}, \text{Vowel length mark}> \\
\end{align*}
\]
4.4.2 Vocalic Letters

The ꞷ VOWEL SIGN REVERSED I is used for writing the four Sanskrit vocalic letters (e.g., Devanagari ऋ, रो, रः, ओ, ओः). They are represented by combining ꞷ VOWEL SIGN REVERSED I with the consonant letters Ꭓ RA and Ꞵ LA; the Ꞹ VOWEL LENGTH MARK is added for the long forms (see figure 17):

\[
\begin{align*}
\text{r} & \quad Ꭓ RA, ꞷ VOWEL SIGN REVERSED I \\
\text{অ} & \quad <consonant, Ꞹ CLUSTER FINAL RA, ꞷ VOWEL SIGN REVERSED I> \\
\text{f} & \quad Ꭓ RA, ꞷ VOWEL SIGN REVERSED I, Ꞹ VOWEL LENGTH MARK \\
\text{অ} & \quad <consonant, Ꞹ CLUSTER FINAL RA, ꞷ VOWEL SIGN REVERSED I, Ꞹ VOWEL LENGTH MARK> \\
\text{l} & \quad Ꞵ LA, ꞷ VOWEL SIGN REVERSED I \\
\text{অ} & \quad <consonant, Ꞹ CLUSTER FINAL LA, ꞷ VOWEL SIGN REVERSED I> \\
\text{l} & \quad Ꞵ LA, ꞷ VOWEL SIGN REVERSED I, Ꞹ VOWEL LENGTH MARK \\
\text{অ} & \quad <consonant, Ꞹ CLUSTER FINAL LA, ꞷ VOWEL SIGN REVERSED I, Ꞹ VOWEL LENGTH MARK>
\end{align*}
\]

As indicated by the independent forms, the Sanskrit vocalic sounds are approximated using the syllables ri, rī, li, lī. The dependent forms are actually conjuncts with ra and la as C₂, occurring as subjoined forms Ꞹ CLUSTER FINAL RA and Ꞹ CLUSTER FINAL LA (see section 4.10). The ꞷ VOWEL SIGN REVERSED I is necessary for properly distinguishing the vowel r in Ꭓ kṛi from the consonant-vowel syllable ri in Ꭓ kri.

Kara (1972) shows the vocalic letters written using the full-arched variant form ꞷ instead of the half arch ꞷ of VOWEL SIGN I: Ꭓ r, Ꭓ r̄, Ꭓ l, Ꭓ l̄. The full-arched forms do not allow for distinctive representations of vocalic letters and consonant-ra or consonant-la syllables, e.g., Ꭓ could be either kṛ or kri, and Ꭓ could be either kli. The Zanabazar Square orthography for Sanskrit vocalic sounds is parallel to that of Tibetan in the UCS, in which ꞷ (U+0F72 TIBETAN VOWEL SIGN I) is reversed as ꞷ (U+0F80 TIBETAN VOWEL SIGN REVERSED I) when writing independent Ꭓ r and Ꭓ l, as well as the dependent forms Ꞹ r and Ꞹ l.

4.4.3 Variant Forms of Vowel Signs

The following vowel signs have alternate representations, which are to be handled as glyphic variants:
The following combining signs are used as nasalization marks and ornaments for the head mark:

<table>
<thead>
<tr>
<th>Vowel Sign I</th>
<th>anusvar</th>
<th>Usage</th>
<th>Vowel Sign U</th>
<th>anusvar</th>
<th>Usage</th>
<th>Vowel Sign OE</th>
<th>anusvar</th>
<th>Usage</th>
<th>Vowel Sign AI</th>
<th>anusvar</th>
<th>Usage</th>
<th>Vowel Sign AU</th>
<th>anusvar</th>
<th>Usage</th>
<th>Vowel Length Mark</th>
<th>anusvar</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vowel Sign I</td>
<td>anusvar</td>
<td>anusvar</td>
<td>instead of  anusvar</td>
<td>anusvar</td>
<td>anusvar</td>
<td>instead of  anusvar</td>
<td>anusvar</td>
<td>anusvar</td>
<td>instead of  anusvar</td>
<td>anusvar</td>
<td>anusvar</td>
<td>instead of  anusvar</td>
<td>anusvar</td>
<td>anusvar</td>
<td>instead of  anusvar</td>
<td></td>
</tr>
</tbody>
</table>

The  anusvar vowel sign I is often written using a full arch  anusvar (see figure 9), which is the most common form for the vowel sign.

The variant form of  anusvar vowel sign OE is  anusvar, which is a reversal of  anusvar vowel sign E.

The alternate form  anusvar of  anusvar vowel sign U is shown in several records (see figure 38).

The variant forms  anusvar and  anusvar of  anusvar vowel sign AI and  anusvar vowel sign AU occur in a single manuscript and show the influence of Tibetan (see figures 48 and 49). The forms  anusvar and  anusvar are variants produced by turning the hook towards the right and left instead of facing them upwards.

The forms  anusvar and  anusvar are shown in secondary sources at the end of a list of syllable-final consonants (see figure 19). These are not distinctive letters, but variant forms of  anusvar, in which the  anusvar vowel length mark is written using the glyphic variants  anusvar and  anusvar.

### 4.5 Vowel Modifiers

The following combining signs are used for representing Sanskrit:

Anusvara indicates nasalization in Sanskrit words. It is transliterated as m, eg.  anusvar am. The sign is not shown in traditional charts, but occurs in the word  anusvar śubham, which is written at the end of charts (see figure 2). When Anusvara occurs in a sequence with a vowel sign it is placed last, eg.  anusvar hum < anusvar ha,  anusvar vowel sign U,  anusvar anusvar>. It corresponds to  anusvar u+0F7E Tibetan sign rjies snga ro.

Visarga indicates post-vocalic aspiration in Sanskrit words. It is generally transliterated as h, eg.  anusvar ah. When the Visarga occurs in a sequence with a vowel sign it is placed last, eg.  anusvar ah < anusvar a,  anusvar vowel length mark,  anusvar visarga>. It corresponds to  anusvar u+0F7F Tibetan sign rnam bcad.

### 4.6 Candrabindu and Candra Ornaments

The following combining signs are used as nasalization marks and ornaments for the head mark:

Candrabindu indicates nasalization in Sanskrit words. It is transliterated as m, eg.  anusvar am. The Candrabindu does not appear in script charts and manuals, but it is attested in various manuscripts, eg. in the word  anusvar hum (see figure 29). It also occurs frequently in combination with  anusvar initial head mark (see
section 4.11). When the CANDRABINDU occurs with a vowel sign, it is always placed after it, eg. 🕄 hum < букв ha, ⦱ vowel sign UE, ⦰ CANDRABINDU>. The sign corresponds to 🕄 \+0F83 TIBETAN SIGN SNA LDAN.

The ⦱ SIGN CANDRABINDU WITH ORNAMENT and ⦰ SIGN CANDRA WITH ORNAMENT are used in combination with the ⦹ INITIAL HEAD MARK (see figure 40). They also occur as the variant, reversed forms 🕄 and 🕄. The SIGN CANDRA WITH ORNAMENT corresponds to 🕄 \+0F82 TIBETAN SIGN NYI ZLA NAA DA.

4.7 Consonant Letters

There are 40 consonant letters:

<table>
<thead>
<tr>
<th>⪁ KA</th>
<th>⪊ TTHA</th>
<th>⪉ PHA</th>
<th>⪈ SMALL A</th>
</tr>
</thead>

<td>⪋ PA</td>
<td>⪋ ZA</td>
<td>⪋ KSSA</td>
</tr>
</tbody>
</table>

4.7.1 Consonant Order

The original Mongolian arrangement and values of the consonant letters are as follows:

| ⪁ ga | ⪋ ka | ⪋ na | ⪋ ja | ⪋ ca | ⪋ ڑa | ⪋ da | ⪋ ta | ⪋ na | ⪋ ba | ⪋ pa | ⪋ ma | ⪋ ya | ⪋ ra | ⪋ va |
| ⪋ la | ⪋ śa | ⪋ sa | ⪋ ha | ⪋ kṣa | ⪋ ṭa | ⪋ ṭha | ⪋ ḍa | ⪋ ḍha | ⪋ ṇa | ⪋ zha | ⪋ za | ⪋ 'a | ⪋ ga | ⪋ gha |
| ⪋ ja | ⪋ jha | ⪋ va | ⪋ da | ⪋ dha | ⪋ ba | ⪋ bha |

This order does not contain letters that are attested in various sources, but that are not found in charts, eg. ⪋ CA, ⪋ CHA, ⪋ JA, ⪋ SSA. It is not clear where these four letters would fit into the above order. The traditional order also includes two instances of the character ⪋ ba, an issue which must be resolved for the proposed encoding. For this reason an arrangement that follows the Tibetan order has been adopted. Letters that are not part of the traditional repertoire are highlighted in red:
4.7.2 Notes on Consonants

ṣ CA, ṝ CHA, ḋ JA  These letters do not occur in traditional script charts, but they occur in manuscripts and secondary sources. It is unclear when they were introduced into the script or by whom. They correspond to the Tibetan characters ལ CA, མ CHA, ཁ JA.

🀔 BA  Traditional charts and secondary sources show two instances of the letter □. It occurs first after ▼ LA and secondly before ▱ BHA. Based upon the occurrences, it is clear that the first □ represents va in Mongolian, while the second □ is used for writing ba in Sanskrit and Tibetan (see figures 15 and 17). As va is represented distinctively using ḋ VA, the letter □ is named BA. It should be noted that □ is often used in place of ▱ VA in Tibetan contexts.

dff DZHA  The letter DZHA represents Sanskrit jha. It is named DZHA instead of JHA because of its graphical similarity to related characters: ḋ TSA, ṝ TSHA, ḍ DZA as opposed to ▱ CA, ṝ CHA, ḋ JA. Also, in the traditional order of the script, ḍ DZHA occurs between ḋ DZA and ḋ VA, which imitates the Tibetan order and further suggests its value as DZHA, corresponding to Tibetan ḋ U+0F60 TIBETAN LETTER DZHA.

 rdr SMALL A  The letter SMALL a corresponds to Tibetan 'a chung (أنشطة U+0F60 TIBETAN LETTER -A). It is used in some instances in place of ▼ vowel length mark for denote a long vowel (see figures 22 and 36). The name of the letter is based upon the corresponding rdr U+0A856 PHAGS-PA LETTER SMALL A instead of the Tibetan name, because usage of a '-' (hyphen) as the Tibetan name for the character -A is no longer permitted according to UCS naming conventions.

 добро SSA  The letter SSA is a reversed form of ḋ SHA and represents the Sanskrit śa. It does not appear in script charts, but it is attested in manuscripts, such as in the Sanskrit invocation written above script charts: ▱ '" namo guru mañjughoṣāya “praise to the preceptor Mañjughoṣa” (see figures 10 and 26). The SSA was introduced into the script by Ugalzyn Lama; it is curious that Zanabazar did not provide a distinctive letter for writing śa in his square script as he did for Soyombo.

rstrip KSSA  The letter ḍ KSSA represents the Sanskrit cluster ḍ kṣa (/kṣa/). While in some Indic scripts the written form for /kṣa/ has an encoded representation as a character sequence, such an approach would not be consistent with the model for Zanabazar Square. In this script, this letter represents a phoneme that is phonetically a consonant cluster, but it has the graphical structure of an atomic letter. It is encoded as a consonant letter because in all cases consonant conjunct forms are written as stacks in Zanabazar Square, not as ligatures. This letter corresponds to ḍ U+0F69 TIBETAN LETTER KSSA.

4.7.3 Representation of Mongolian, Sanskrit, and Tibetan Consonants

Zanabazar Square consonants possess different values based upon linguistic context. For Mongolian the letters for voiceless sounds ( ซึ่ง KA, ḋ CA, ḋ TA, ḏ PA) are used for voiced stops, while letters for voiceless
aspirated sounds (𑨌 KHA, 𑨑 CHA, 𑨚 THA, 𑨟 PHA) are used for voiceless stops. The values of consonants for Mongolian (‘M’), Sanskrit (‘S’), and Tibetan (‘T’) are given below:

<table>
<thead>
<tr>

The letters 𑱜 and 𑱡 are reversed forms of 𑱝 TA and 𑱝 NA, which are used for representing the Sanskrit retroflex sounds ta and na. Figure 26 shows a subjoined form of 𑱝 in the conjunct 𑱝 sṯa; figure 27 shows 𑱡 in the word 𑱡𑱡 Gujarati mani. There exist distinctive letters for ta and na — 𑱝 TTA and 𑱝 NNA — however, the practice
of reversing 𑨙 ta and 𑨝 na for 𑨙 ta and 𑨝 na is borrowed from Tibetan, in which the letters for the dental consonants 𑨙 ta, 𑨝 tha, 𑨝 da, 𑨝 dha, 𑨝 na are reversed for producing the retroflex consonants 𑨙 ta, 𑨝 tha, 𑨝 da, 𑨝 dha, 𑨝 na; and the palatal sibilant 𑨝 sa is reversed for the retroflex sibilant 𑨝 sa. The use of reversed letters for representing sounds for which distinctive letters exist may be interpreted as scribal idiosyncrasies, which result from imprecise knowledge of the script by the writer, who nonetheless has knowledge of Tibetan. Although 𑨙 ta and 𑨝 na are distinct from the regular letters, their occurrence is limited to a single source. Until additional evidence of their usage is found, they are not proposed for encoding.

Scribal idiosyncrasy may also explain the use of the form 𑨦 for writing 𑨙   in figure 35. This form of 𑨙   is based upon the Tibetan dbu med shape ང of the regular dbu can form ང 'a chung. Similarly, the reversed form 𑨧 of 𑨙   is used in figure 36. Similarities between character glyphs may account for the usage of 𑨧 for 𑨙   in one manuscript. The form 𑨧 is derived by attaching a hook to 𑨧 . It is likely the result of the scribe writing the left vertical stroke of 𑨧 as a curve from the left terminals instead of as a straight line.

Misinterpretation of glyph boundaries in traditional charts may explain the alternate form 𑨧 of 𑨙  and the form 𑨧 for 𑨙 va (see figure 38). In the traditional ordering of the script, the 𑨙  and 𑨙 va occur at the end of sequences of letters, e.g. “𑨧𑨧” da dha | and “𑨧𑨧” dza dzha va |. In some manuscripts that show the repertoire of the script, the spacing between letters and the punctuation mark l shad is rather tight, so “𑨧” and “𑨧” may be read incorrectly as “𑨧” and “𑨧”, in which the shad is seen not as punctuation, but as part of the glyph (see figure 37).

Explanations for other alternate forms require further research. The source for the variant 𑨧 for 𑨧 gha as shown in figure 9 is unidentified. The form 𑨧 for 𑨧 na is shown in figure 28, where both forms are used simultaneously. There is no semantic distinction between 𑨧 and 𑨧. It is unclear why the scribe used two different forms of NA in such close promixity in a single document.

4.8 Consonant Modifiers

4.8.1 Final Consonant Mark

The 𑨛 FINAL CONSONANT MARK is used in Mongolian contexts for marking syllable-final consonants. On account of this function, it also serves as a syllable-boundary mark, similar to 𑨛 ཤ U+0F0B TIBETAN MARK INTERSYLLABIC TSHEG. It has no control properties. Although it can combine only with a single consonant, there is a single record written in Tibetan in which the FINAL CONSONANT MARK is used below conjuncts and after vowels. This usage is irregular and is likely the result of a scribe using the mark, not as a vowel silencer, as a generic syllable mark instead of specifically as a final-consonant mark. The FINAL CONSONANT MARK occurs in one Mongolian record as 𑨛 (see figure 34), which is considered a glyphic variant of 𑨛.

4.8.2 Virama

The 𑨛 VIRAMA is used in Sanskrit and Tibetan contexts for silencing the inherent vowel of a consonant letter. It can occur only with a consonant. It also specifies that if the bare consonant is followed by another consonant, then the bare consonant is part of a cluster involving the following consonant (see section 4.10). It does not mark syllabic boundaries.

Although VIRAMA is not part of the traditional repertoire of Zanabazar Square, it is attested in texts (see figure 30). It corresponds to the Lantsa, Wartu, and Tibetan sign halanta, as shown in figure 30. In addition to silencing the inherent vowel of a consonant, the Zanabazar Square VIRAMA is used for representing conjuncts
Proposal to Encode the Zanabazar Square Script in ISO/IEC 10646  Anshuman Pandey

in encoded text: a sequence of bare consonants marked by the sign will be displayed as conjunct stacks. Given the form and function of the character in Zanabazar Square, \textsc{virama} is an appropriate name for the sign as it corresponds to other \textsc{virama} characters in scripts in the UCS, such as \textsf{U+094D DEVANAGARI SIGN VIRAMA}. In previous versions of the proposal, the \textsf{virama} was called \textsf{subjoiner}. It was proposed as a character for controlling conjunct formation using a generic glyph. While the \textsf{subjoiner} was suitable, it was more appropriate to unify its function with that of the \textsc{virama}, which fits the graphical model of the script.

4.8.3 Necessity for Two Vowel-Silencing Marks

The \textsf{virama} \textsc{final consonant mark} and \textsf{virama} \textsc{virama} may be considered graphical variants of a single vowel-silencing mark. However, as explained in the above descriptions of each mark, it is necessary to treat them as separate characters in the encoding on account of their language-specific semantics and behavior. The distinct semantics of both characters is is exhibited by the following encoded sequence, in which \textsf{virama} represents a single \textsc{silencer} mark for purposes of illustration:

\begin{verbatim}
<N SA, O VOWEL SIGN E, THA, O silence, KHA, O VOWEL SIGN I, LA, O silence, PA, O VOWEL SIGN E, RA, O silence>
\end{verbatim}

The above sequence would be rendered in a Mongolian context as སེད་ཀྲིད་བེར་ and in a Sanskrit or Tibetan context as སེན་ཁིལ་པེར་.

From a character-encoding perspective, although the \textsc{silencer} indicates bare consonants in both of the above cases, it also conveys additional details regarding the display of the consonants based upon linguistic context. In the Mongolian example, the \textsc{silencer} indicates that \textsc{THA}, \textsc{LA}, and \textsc{RA} are bare consonants and that they occur at the end of a syllable. In the Sanskrit example, the \textsc{silencer} indicates that \textsc{THA}, \textsc{LA}, and \textsc{RA} are bare consonants and are part of a cluster if followed by a consonant, and that the cluster should be rendered as a conjunct.

In plain-text environments, there is no means of instructing the \textsc{silencer} to behave as would be expected in different linguistic contexts. For this reason, it is necessary to separate the two functions of the \textsc{silencer} into separate characters: one that marks bare consonants in syllable-final position and the other that marks bare consonants in a consonant cluster: the \textsc{final consonant mark} and \textsc{virama}, respectively. These two characters offer a feasible method of differentiating the representation of the example sequence in Mongolian and Sanskrit contexts:

\begin{verbatim}
NOUN sed-kil-ber <N SA, O VOWEL SIGN E, THA, O FINAL CONSONANT MARK, KHA, O VOWEL SIGN I, LA, O FINAL CONSONANT MARK, PA, O VOWEL SIGN E, RA, O FINAL CONSONANT MARK>
\end{verbatim}

\begin{verbatim}
NOUN setkhilper <N SA, O VOWEL SIGN E, THA, O VIRAMA, KHA, O VOWEL SIGN I, LA, O VIRAMA, PA, O VOWEL SIGN E, RA, O VIRAMA>
\end{verbatim}

4.9 Mongolian Final Consonants

Mongolian words may end with the following codas: \textsc{g}, \textsc{k}, \textsc{ng}, \textsc{d}, \textsc{n}, \textsc{b}, \textsc{m}, \textsc{r}, \textsc{l}, \textsc{s}, \textsc{š}. These are shown in charts as ལེགས། ag, ལེགས། ak, ལེགས། an, ལེགས། ab, ལེགས། am, ལེགས། ar, ལེགས། al, ལེགས། aš, ལེགས། as; the initial
A is used for illustrating a basic syllable. Syllable-final consonants are indicated by placing the \( \cdot \) final consonant mark beneath a letter, as follows:

\[
\begin{align*}
g \ &= \ 𑨀 ka, \ \cdot \text{final consonant mark} \\
k \ &= \ 𑨢 kha, \ \cdot \text{final consonant mark} \\
ng \ &= \ 𑨐 nga, \ \cdot \text{final consonant mark} \\
d \ &= \ 𑨝 ta, \ \cdot \text{final consonant mark} \\
n \ &= \ 𑨠 na, \ \cdot \text{final consonant mark} \\
b \ &= \ 𑨐 pa, \ \cdot \text{final consonant mark} \\
m \ &= \ 𑨠 ma, \ \cdot \text{final consonant mark} \\
r \ &= \ 𑨝 ra, \ \cdot \text{final consonant mark} \\
l \ &= \ 𑨡 la, \ \cdot \text{final consonant mark} \\
š \ &= \ 𑨠 sha, \ \cdot \text{final consonant mark} \\
s \ &= \ 𑨠 sa, \ \cdot \text{final consonant mark}
\end{align*}
\]

The 𑨠 \( \ddot{a} \) is shown at the end of the syllable-final letters. It is glossed as \( \ddot{a} \) in several manuscripts. Kara (1972) represents 𑨠 as 𑨠 ‘aⁿ’, while Shagdarsüürg (2001) represents it as 𑨠 ‘āṉ’. These transliterations indicate that Kara and Shagdarsüürg assign a nasal value to 𑨠, but they do not offer evidence for their claims. Moreover, such usage is not attested in the available sources. Byambaa Ragchaagin (2005) equates the 𑨠 that occurs among the syllable-final letters with the vowel \( \ddot{a} \). The manuscript sources suggest that the occurrence of 𑨠 here simply indicates that a Mongolian syllable may end with this long vowel.

### 4.10 Consonant Conjuncts

Consonant clusters are written as conjuncts, which are rendered as vertical stacks with non-initial letters descending sequentially beneath the initial letter, eg. 𑨠 na + 𑨢 da is written as 𑨠 nda. Letters are displayed using their regular shape, with the exception of four letters: 𑨠 ya, 𑨡 ra, 𑨢 la, 𑨡 va. The forms of these letters are determined by their position in a cluster and the linguistic context in which they occur. In general, the full forms of these letters are used for Sanskrit conjuncts, while contextual alternates are used for Tibetan, but variation does occur (see figures 24):
Given that only four consonants exhibit special shaping behavior in stacks, the encoded representation of conjuncts requires a subjoining model that utilizes ◌ virama for controlling stacking behavior, as well as 5 characters for the contextual forms of ya, ra, la, va:

```
+---+   +---+   +---+
| T | RA | Q | YA | Q | LA |
+---+   +---+   +---+
     | RA | Q | VA |
```

The ◌ CLUSTER INITIAL RA can occur only at the head of a cluster and must be followed by consonant letter. By implication, it is the logical base letter of a conjunct and any following consonant letter is always subjoined, therefore virama is not to be used in conjunction with it.

The ◌ CLUSTER FINAL YA, ◌ CLUSTER FINAL RA, ◌ CLUSTER FINAL LA, ◌ CLUSTER FINAL VA may occur only in the penultimate and final positions in a cluster. They are combining characters and logically combine with the preceding consonant. As inherently subjoined forms, the virama is not used with these letters, either in a preceding or following position. These cluster-final letters may occur after each other in the penultimate and final positions in a cluster, but as virama cannot combine with them, these letters cannot be used medially.

### 4.10.1 Rationale for the Encoding Model for Conjuncts

The visual model for encoding Zanabazar Square conjuncts provides for all stacks that may occur in Sanskrit and Tibetan. It also eliminates the need to adopt the Tibetan subjoined-letter model for Zanabazar Square, which would require the independent encoding of a full set of subjoined letters for each consonant letter, in addition to context-specific forms of ya, ra, la, va. The decision to encode a CLUSTER INITIAL RA instead of relying on the font to change the shape of ra from full-form to head-position is made in order to eliminate the need to encode two characters that have the same nominal appearance, but different conjoining behaviors, as is the case for Tibetan in the UCS, eg. ᆝ U+0F62 TIBETAN LETTER RA and ᆞ U+0FBC TIBETAN LETTER FIXED-FORM RA. The proposed model simply utilizes separate characters for each semantically distinctive form of a consonant. All other consonants are rendered in stacks using the virama, which simply subjoins one letter beneath the other and does not initiate a shape change of a consonant.

### 4.10.2 Encoded Representation of Conjuncts

A conjunct stack is represented in encoded text by placing a virama after each consonant in a cluster except for the last: <consonant, ◌ virama, [consonant, ◌ virama,]* consonant>. The virama specifies that the consonant to which it is attached is a bare consonant and that the following letter is to be placed beneath it; the same rule applies to each subsequent consonant to which virama is attached. As virama behaves as a control character when it occurs between two consonants, it is not displayed visibly in the stack (see sections 4.10.3 and 4.17.5 for additional details on the rendering of stacks):

```
\[ \text{na} \] <\[ \text{NA}, ◌ \text{VIRAMA} >
\[ \text{nda} \] <\[ \text{NA}, ◌ \text{VIRAMA}, سلاح \text{DA} >
\[ \text{ndra} \] <\[ \text{NA}, ◌ \text{VIRAMA}, سلاح \text{DA}, ◌ \text{VIRAMA}, ᆝ \text{RA} >
```

The exceptions to the usage of virama in producing conjuncts are ◌ CLUSTER INITIAL RA, ◌ CLUSTER FINAL YA, ◌ CLUSTER FINAL RA, ◌ CLUSTER FINAL LA, ◌ CLUSTER FINAL VA. The usage of these letters in stacks is
shown in the examples below:

\[
\begin{align*}
\text{ŋ kya} & <\text{ŋ KA, O VIRAMA, W YA}> \\
\text{ŋ kya} & <\text{ŋ KA, O CLUSTER FINAL YA}> \\
\text{ŋ rka} & <\text{ŋ RA, O VIRAMA, ŋ KA}> \\
\text{ŋ rka} & <\text{ŋ CLUSTER INITIAL RA, ŋ KA}> \\
\text{ŋ kra} & <\text{ŋ KA, O VIRAMA, ŋ RA}> \\
\text{ŋ kra} & <\text{ŋ KA, O CLUSTER FINAL RA}> \\
\text{ŋ kla} & <\text{ŋ KA, O VIRAMA, ŋ LA}> \\
\text{ŋ kla} & <\text{ŋ KA, O CLUSTER FINAL LA}> \\
\text{ŋ kva} & <\text{ŋ KA, O VIRAMA, ŋ VA}> \\
\text{ŋ kva} & <\text{ŋ KA, O CLUSTER FINAL VA}>
\end{align*}
\]

Using virama with the 5 conjunct-specific letters will yield meaningless sequences:

\[
\begin{align*}
\text{ŋ} & <\text{ŋ CLUSTER INITIAL RA, O VIRAMA, ŋ KA}> \\
\text{ŋ} & <\text{ŋ KA, O VIRAMA, O CLUSTER FINAL RA}> \\
\text{ŋ} & <\text{ŋ KA, O CLUSTER FINAL RA, O VIRAMA}>
\end{align*}
\]

Naturally, in a conjunct the only letter that can possess a vowel is the final letter in the cluster. Any vowel or other combining signs must be placed after the final letter in a conjunct:

\[
\begin{align*}
\text{ŋ ndi} & <\text{ŋ NA, O VIRAMA, ŧ DA, O VOWEL SIGN I}> \\
\text{ŋ ndru} & <\text{ŋ NA, O VIRAMA, ŧ DA, O CLUSTER FINAL RA, O VOWEL SIGN U}> \\
\text{ŋ ndum} & <\text{ŋ NA, O VIRAMA, ŧ DA, O VOWEL SIGN UE, O SIGN ANUSVARA}>
\end{align*}
\]

4.10.3 Controlling Conjunct Formation

As is the convention for conjunct models based upon virama, conjunct formation may be broken by placing the generic non-printing, control character \[\text{\textbullet U+200C} \text{ ZERO WIDTH NON-JOINER} \] (abbreviated as ZWNJ) after virama. This results in the display of a visible form of the sign, compare the following:
The following conjuncts are shown in traditional script charts:

- \( \text{nda} \) \( <\text{na}, \text{virama}, \text{da}> \)
- \( \text{nds} \) \( <\text{na}, \text{virama}, \text{zwnj}, \text{da}> \)
- \( \text{ndra} \) \( <\text{na}, \text{virama}, \text{da}, \text{virama}, \text{ra}> \)
- \( \text{snds} \) \( <\text{na}, \text{virama}, \text{zwnj}, \text{da}, \text{virama}, \text{zwnj}, \text{ra}> \)

The use of \( \text{zwnj} \) is necessary for representing clusters like \( \text{msta} \), which occurs in the phrase \( \text{subhamstu} \) and \( \text{rsa} \), which occurs in the phrase \( \text{kasyabar sarva} \) in figure 30. As shown below, if \( \text{zwnj} \) is not used, the \( \text{virama} \) will produce a stack instead of a consonant with a visible \( \text{virama} \):

- \( \text{msta} \) \( <\text{ma}, \text{virama}, \text{n sa}, \text{virama}, \text{ta}> \)
- \( \text{msds} \) \( <\text{ma}, \text{virama}, \text{zwnj}, \text{n sa}, \text{virama}, \text{ta}> \)
- \( \text{rsa} \) \( <\text{ra}, \text{virama}, \text{n sa}> \)
- \( \text{rsds} \) \( <\text{ra}, \text{virama}, \text{zwnj}, \text{n sa}> \)

As there are no half-forms of consonants in Zanabazar Square, the usage of \( \text{d0} \) \( \text{u+200d} \) \( \text{zero width joiner} \) does not produce any valid output.

### 4.10.4 Conjuncts Shown in Traditional Script Charts

The following conjuncts are shown in traditional script charts: \( \text{kra}, \text{khya}, \text{gla}, \text{rka}, \text{sk}, \) \( \text{lka} \). They are not independent characters, but are ligatures that represent consonant conjuncts. They are represented in encoded text as follows:

- \( \text{kra} \) \( <\text{ka}, \text{cluster final ra}> \)
- \( \text{khya} \) \( <\text{kha}, \text{cluster final ya}> \)
- \( \text{gla} \) \( <\text{ga}, \text{cluster final la}> \)
- \( \text{rka} \) \( <\text{cluster initial ra}, \text{ka}> \)
- \( \text{sk} \) \( <\text{n sa}, \text{virama}, \text{ka}> \)
- \( \text{lka} \) \( <\text{la}, \text{virama}, \text{ka}> \)

It is likely that \( \text{kra}, \text{khya}, \text{gla} \) are presented for illustrating the cluster-final forms of \( \text{ya}, \text{ra}, \text{la} \) and the cluster-initial form of \( \text{ra} \). The presence of \( \text{sk} \) and \( \text{lka} \) in this list is intended for illustrating the representation of Tibetan \( \text{sa-mgo} \) and \( \text{sa-mgo} \) letters. The glyphs \( \text{sk} \) and \( \text{lka} \) are stylized ligatures of \( \text{s} \) and \( \text{l} \), respectively.
4.10.5 Depth of Conjunct Stacks

Zanabazar Square stacks may consist of numerous consonants. The deepest stack shown in the available sources contains three consonants: 𑩃𑩅𑩇 mprā. However, as Zanabazar Square is used for representing Tibetan, the rendering engine must be able to manage stacks consisting of greater than three consonants.

4.11 Head Marks

Sources show 𑨿𑨶 and the variants 𑨿𑨵, 𑨿𑨷, 𑨿𑨸 as a head mark used at the beginning of texts (see figure 40 for more variants). Rather than encode one of these as the normative form or each as a separate head-mark character, it is sensible to analyze the mark as consisting of a base character and a combining sign. This approach offers the possibility of representing various forms simply by establishing a bare head mark to which signs proposed for encoding in section 4.6 may be attached. Moreover, as figure 40 illustrates, the head mark may be used without an ornament, even if such usage is rare.

The plain form is proposed for encoding as 𑨨 INITIAL HEAD MARK. It corresponds to 𠅑 U+0FD3 TIBETAN MARK INITIAL BRDA RNYING YIG MGO MDUN MA. The various forms of the initial head mark may be represented in encoded text as follows:

- 𑩃 INITIAL HEAD MARK, Ҫ SIGN CANDRABINDU>
- 𑩅 INITIAL HEAD MARK, Ҫ SIGN CANDRABINDU WITH ORNAMENT>
- 𑩇 INITIAL HEAD MARK, Ҫ SIGN CANDRA WITH ORNAMENT>
- 𑩈 INITIAL HEAD MARK, Ҫ SIGN ANUSVARA>

Additionally, the 𑩉 CLOSING HEAD MARK is proposed for encoding in order to produce a double head mark. It corresponds to ],& U+0FD4 TIBETAN CLOSING MARK BRDA RNYING YIG MGO MDUN MA. It is placed after 𑩃 INITIAL HEAD MARK for producing 𑩃<𑩃 INITIAL HEAD MARK, 𑩉 CLOSING HEAD MARK>, cf. Tibetan ༄༅. It is possible to encode 𑩃 as a separate character, as was done for 𠃧 U+0875 PHAGS-PA DOUBLE HEAD MARK; however, analyzing this mark as consisting of ‘initial’ and ‘closing’ parts enables the representation of extended head marks, such as ]&(Resources), which aligns with Tibetan ས༅.

Figure 41 shows a mark ],& which corresponds to Tibetan ས༅. This mark is to be considered a glyphic variation of ],& where ],& = 𑩃 INITIAL HEAD MARK and ],& = 𑩉 CLOSING HEAD MARK. Although these forms are encoded as distinct characters for Tibetan (>& U+0F04 TIBETAN MARK INITIAL YIG MGO MDUN MA and ],& U+0F05 TIBETAN MARK CLOSING YIG MGO SGAB MA), for Zanabazar Square it is appropriate to treat them as variants because of their limited occurrence. As such, their display is to be managed through fonts.

The 𑩃 INITIAL HEAD MARK, and a following 𑩉 CLOSING HEAD MARK, is typically followed by a 𑩃 shad or PasswordField double shad, eg. 𑩃𑩃, 𑩃𑩅, 𑩃𑩇. In such cases, the shad and double shad are to be placed at the end of the sequence, eg. 𑩃𑩇 is represented as <𑩃 INITIAL HEAD MARK, Ҫ SIGN CANDRA WITH ORNAMENT, 𑩇 DOUBLE SHAD>.
4.12 Punctuation

The following characters are used for punctuation:

ʼ TSHEG is used for indicating the end of a syllable in Tibetan contexts. It corresponds to \U+0F0B TIBETAN MARK INTERSYLLABIC TSHEG. Although the \U+0F0D TIBETAN MARK FINAL CONSONANT is generally used for marking syllabic boundaries, the TSHEG is proposed for inclusion in the script block because of attested usage (see figures 46 and 47).

<table>
<thead>
<tr>
<th>\U+0F0C SHAD</th>
<th>\U+0F0D TIBETAN MARK SHAD</th>
</tr>
</thead>
<tbody>
<tr>
<td>\U+0F0E DOUBLE SHAD</td>
<td>\U+0F0F TIBETAN MARK NYIS SHAD</td>
</tr>
<tr>
<td>\U+0F10 LONG TSHEG</td>
<td>\U+0F11 TIBETAN MARK GTER TSHEG</td>
</tr>
</tbody>
</table>

4.13 Digits

Digits are not attested. The available sources do not indicate the use of digits or number forms in the script.

4.14 Collation

The default sort order for Zanabazar Square is based for the most part upon the order for Tibetan:

```
<kang> | <kangsa> | <kha> | <ga> | <gha> | <nga> | <ca> | <cha> |
<ja> | <nya> | <tta> | <tha> | <dda> | <dda> | <nna> | <ta> |
<tha> | <da> | <dha> | <na> | <pa> | <pha> | <ba> | <bha> |
<ma> | <tsa> | <tsha> | <dza> | <dzhha> | <zha> | <za> |
<smal a> | <ya> | <cluster final ya> | <cluster initial ra> | <ra> |
<cluster final ra> | <la> | <cluster final la> | <va> |
<cluster final va> | <sha> | <ssa> | <sa> | <ha> | <a> |
<vowel sign i> | <vowel sign ue> | <vowel sign u> | <vowel sign e> |
<vowel sign oe> | <vowel sign o> | <vowel sign ai> | <vowel sign au> |
<vowel sign reversed i> | <vowel length mark> | <final consonant mark>
```

The following characters have secondary weights:

\U+0F12 CANDRABINDU, \U+0F13 CANDRABINDU WITH ORNAMENT, \U+0F14 CANDRA WITH ORNAMENT, \U+0F15 ANUSVARA, \U+0F16 VISARGA
4.15 Vertical Text

Although Zanabazar Square was designed to be written horizontally, there are some instances in the available sources in which the script is oriented vertically, for example, the words haṃkṣalavaraya (see figure 21) and thālīṃ (see figures 22 and 36):

\[\text{𑨱𑨵𑨲𑨢𑨬𑨭𑨫𑨪} \text{haṃkṣalavaraya} \]

\[\text{𑨚𑨁𑨸𑨩} \text{thalīṃ} \]

The graphical representation of vertical text is identical to that of conjuncts: letters are written in their normal, upright shape and are positioned sequentially beneath the first letter of the word, and signs are positioned as they are in conjuncts (see section 4.17). Given this, haṃkṣalavaraya and thālīṃ may be incorrectly parsed as the conjuncts *hkṣmlvryaṃ and *thl’īṃ, respectively.

Although the vertical orientation of haṃkṣalavaraya and thālīṃ may be produced in encoded text as false conjuncts by placing virama after each consonant letter, such an approach is not recommended because it obscures the semantic value of the words. For instance, in the correct encoded representation of haṃkṣalavaraya the ◀ Candrabindu attaches to ḡ HA, but an attempt to produce the desired output as a conjunct would require that the ◀ Candrabindu be attached, incorrectly, to ṭ YA; naturally, combining signs can attach only to the final consonant of a conjunct. Similarly, for thālīṃ, both ◀ Vowel Sign I and ◀ Anusvara combine logically with ṭ LA, but if the word is encoded as a false conjunct, the signs would need to be combined with ṭ THA.

The word thālīṃ is a special case. Byambaa Ragchaaqiiin states that the word is a Tantric mantra and is always written vertically, as shown above, and does not occur horizontally as *بذل‫ه‬.

Vertical text is outside of the purview of the encoding, which is intended for the representation of plain text. Therefore, the display of vertical text must be managed at the presentation layer. It may be possible to control vertical orientation in OpenType fonts using the ‘vert’ feature. The basic rules for Zanabazar Square in vertical environments is that text must be set top-to-bottom, left-to-right, with upright glyphs. The recently published “Unicode Technical Report #50: Unicode Vertical Text Layout” describes the character property Vertical_Orientation (vo) for specifying default character orientation (Ishii 2013). For Zanabazar Square, the property would be defined as Vertical_Orientation=U (vo=U), where the value ‘U’ indicates that the glyphs remain upright in both horizontal and vertical text layout, as shown in the code chart.

4.16 Combining Behavior

Multiple signs may combine with a base letter. The example shown below is theoretical and does not occur in attested texts, but it is nonetheless a valid encoded sequence for Zanabazar Square and illustrates the textual and graphical possibilities that rendering engines and fonts must be able to process and display.
The above example, which could be transliterated as rktvřumh, is produced using 13 characters. See section 4.17.3 for rules regarding the placement of vowel signs with conjuncts.

4.17 Glyph Interactions

4.17.1 Size of Vowel Signs for Use With Letter A

The widths of glyphs for Zanabazar Square consonant letters are uniform, however, the ल A is wider than the consonants. This width difference requires a separate set of extra-wide vowel signs for use with A, compare, ढ and ल, ढ and ल. With width variant forms, the combinations with A should resemble ल and ल.

4.17.2 Placement of Multiple Combining Signs

When multiple signs occur combine with a base letter in the same position, it may be necessary to adjust the glyphs in order to prevent clashing. This may be achieved in various ways (signs are marked in red). One is to horizontally extend the anchor of the sign:

<леж ka, ो vowel sign e, छ vowel sign ai (variant)> = ढ → ढ kei

Another is to horizontally condense the shape of one sign and to place both laterally:

<леж la, ो vowel sign i, छ vowel length mark, अ sign anusvara> = ढ → ढ līṃ

A third is to alter the vertical position of a sign:

<леж a, ो vowel sign o, अ sign anusvara> = ढ → ढ om

<леж na, ो virama, ध da, छ cluster final ra, ो vowel sign u> = ढ → ढ ndru

4.17.3 Placement of Vowel Signs in Conjuncts

Although all vowel signs are combined with the final letter in the encoded representation of a conjunct, the placement of signs upon the stack is dependent upon the combining behavior of the sign (marked in red):

Above-base vowel signs are placed above the initial letter:

陟 ndi <леж na, ो virama, ध da, ो vowel sign i>

Below-base vowel signs (including छ vowel length mark) are placed beneath the final letter:
Right and left spacing marks are positioned on the respective sides of the initial letter:

\[ ndai \quad <\text{NA}, \text{VIRAMA}, \text{DA}, \text{VOWEL SIGN AI}> \]
\[ ndau \quad <\text{NA}, \text{VIRAMA}, \text{DA}, \text{VOWEL SIGN AU}> \]

The above rules apply to cases where multiple vowel signs and modifiers occur at the end of a conjunct:

\[ ndi \quad <\text{NA}, \text{VIRAMA}, \text{DA}, \text{VOWEL SIGN I}, \text{VOWEL LENGTH MARK}> \]
\[ ndauh \quad <\text{NA}, \text{VIRAMA}, \text{DA}, \text{VOWEL SIGN AU}, \text{SIGN VISARGA}> \]
\[ ndôm \quad <\text{NA}, \text{VIRAMA}, \text{DA}, \text{VOWEL SIGN O}, \text{VOWEL LENGTH MARK}, \text{ANUSVARA}> \]

When \( \text{CLUSTER INITIAL RA} \) occurs in a conjunct, above-base marks attach to it, while all other marks attach to the following consonant based upon the rules stated above:

\[ rki \quad <\text{CLUSTER INITIAL RA}, \text{KA}, \text{VOWEL SIGN I}> \]
\[ rkai \quad <\text{CLUSTER INITIAL RA}, \text{KA}, \text{VOWEL SIGN AI}> \]

When \( \text{VOWEL LENGTH MARK} \) occurs with \( \text{CLUSTER FINAL YA}, \text{CLUSTER FINAL RA}, \text{CLUSTER FINAL LA}, \text{CLUSTER FINAL VA} \), the mark attaches to the letter which the cluster-final letter combines:

\[ krā \quad <\text{KA}, \text{CLUSTER FINAL RA}, \text{VOWEL LENGTH MARK}> \]

### 4.17.4 Positioning of CLUSTER INITIAL RA

The \( \text{CLUSTER INITIAL RA} \) is positioned at the normal head height, not above it. For this reason, it may be necessary to adjust the height of the following consonant letter in order to accommodate fit:

\[ <\text{CLUSTER INITIAL RA}, \text{KA}> = \text{KA} \rightarrow \text{KA} \]

### 4.17.5 Subjoined Glyphs for Rendering Conjuncts

A Zanabazar Square font must contain a full set of subjoined forms for each consonant letter. The font will produce a consonant stack by substituting each \( \text{VIRAMA, consonant} \) pair with a subjoined form of the
consonant letter. If the subjoined glyph is not available in the font, the virama will be displayed visibly along with the regular glyph of the letter whose subjoined form is missing. For example, if the subjoined form 𑨛 of 𑨝 is unavailable, then a sequence such as <𑨝, 𑨛, 𑨝> will be rendered as 𑨝𑨛 instead of the expected 𑨝.

4.17.6 Positioning and Sizing of Letters in Conjunct Stacks

There are no formal rules for sizing character glyphs within a stack. However, based upon an examination of conjunct styles in manuscripts, it is evident that scribes adjust the size of letters in stacks for visual uniformity with surrounding characters. Shown below is the word dhumprāndhāḥ rendered in three different ways:

The default method involves no size changes and uses the regular forms of letters (column ‘A’). In some sources, the regular glyph size of the initial letter is used, while the glyph of a non-initial consonant is compressed along the vertical axis such that their x-height is similar to that of below-base signs (see figure 4 and column ‘B’). A third practice is to vertically condense the glyphs for the base and subjoined letters such that the height of the stack matches the height of the surrounding letters (see figure 23 and column ‘C’). Depending on the head-height of surrounding letters, such size adjustments may be practical only for stacks consisting of two letters.

5 Character Data

6 References

Acknowledgments

I express my gratitude to Agata Bareja-Starzyńska (University of Warsaw, Poland) for sharing her knowledge of the script, for her diligent review of the information I have presented, and for enlightening discussions on the script and comments regarding the character repertoire, character names, encoding order, and language-specific transliterations. I am also thankful to Byambaa Ragchaagiin, who provided a copy of his book Занабазарын Дөрвөлжин Үсэг, which contains several manuscripts and other records which facilitated my analysis of the script. He also granted permission for usage of images of the folios shown in figure 6.

I also owe much thanks to Shriramana Sharma, Peter Constable (Microsoft), and Andrew Glass (Microsoft) for providing detailed comments on the encoding model for consonant conjuncts and various other aspects of the encoding for the script. Laurentiu Iancu (Microsoft) and Ken Whistler (SAP) explained the representation of vertical text. Andrew West and Christopher Fynn provided information on the orthography of conjunct stacks in Tibetan. György Kara (Indiana University, Bloomington) patiently answered several questions during the preliminary stages of my research. Biligsaikhan Batjargal (Ritsumeikan University, Japan) provided information on the Mongolian name of the script for the preliminary proposal.

This project was made possible in part by an earlier grant from the United States National Endowment for the Humanities, which funded the Universal Scripts Project (part of the Script Encoding Initiative at the University of California, Berkeley). Any views, findings, conclusions or recommendations expressed in this publication do not necessarily reflect those of the National Endowment for the Humanities.

Figure 20: Description of the letters Б, в, г, д, е, ж, which are not enumerated in traditional charts (from Byambaa Ragchaagiin 2005: 32).
Figure 21: Excerpt from a folio shown in figure 3 illustrating Zanabazar Square text written vertically. The text is hamṃṣamalavaraya, which may be incorrectly interpreted as a conjunct representing hksmlvryam.

Figure 22: Seal showing the word ṭhālīṃ thalīṃ written vertically in the Zanabazar Square script (from Byambaa Ragchaagiin 2005: 97). Note the use of ꜏ small a instead of Ꝑ vowel length mark for indicating ī. Also note the combining signs for ꜏ la placed above ꜏ tha.
Figure 23: A manuscript containing text in Soyombo and Zanabazar Square (from Tseveliin Shagdarsüürün 2001: 173). Note the sizing of consonant stacks, such that the letters are reduced so that the height of the stack matches the regular letter height.

Figure 24: Folio showing Sanskrit written in Zanabazar Square (from Byambaa Ragchaagiin 2005: 103). Con juncts with the full forms of य या, र रा, and ब बा as C2 are shown: व yā, भ brā, म mba, म्प्रा mprā, ङ lva. Also shown is the conjunct न्दहा ndha.
Figure 25: Folio showing the conjunct ṣṭa (from Byambaa Ragchaagiin 2005: 103). Compare to the form of the conjunct shown in figure 26.

Figure 26: Detail of manuscript from figure 4 showing the conjunct ṣṭa written as ṣṭ instead of the expected ṣṭ. Here the ta is represented with a reversed form ṭa of ṭa instead of ṭa. See section 4.7.4 for more information on the use of reversed letters in Zanabazar Square. The other conjunct involving ssṭ in this folio is ssṭa, which is written as expected.
Figure 27: The use of ṇ, a reversed form of textView, instead of ViewSet for writing the Sanskrit retroflex na in the word भविष्य mani (excerpted from Bareja-Starzyńska and Ragchaa 2012: folio 7a).

Figure 28: Usage of the variant form झ (highlighted in red) of झ NA (highlighted in blue) (from Byambaa Ragchaagiin 2005: 85). There is no semantic distinction between the variant and normative form; they both represent na.

Figure 29: Excerpt from a folio shown in figure 3 illustrating the usage of SIGN CANDRABINDU.
In the top folio, **virama** occurs with क in जन्नत kasyabar (जन्त kasyapah “Kasyapa” is likely intended). The expected representation of the phrase is जन्नतोऽवरुण kasyabah-sarvakulādhīpatya “Kasyapa, the sovereign of all clans”; the ෘ h is written as क r due to incorrect application of sandhi). In the middle folio the **virama** occurs with म म a twice in the phrase शुभमस्तु-सर्व-जगतम śubhamstu-sarva-jagatam “may there be auspiciousness in all the world”; the use of **virama** in शुभम is curious because in Sanskrit the word would join with the following श stu (correct: astu) as शुभम शुभमस्तु. In the bottom folio the **virama** occurs with द in the word गोश hyavatad (correct: गोश hyavadat) “thusly explained”.

Figure 30: Folios showing usage of the **virama** (from Byambaa Ragchaagiin 2005: 113–114).
Figure 31: Usage of final consonant mark for representing Mongolian final consonants (from Byambaa Ragchaagiin 2005: 63).

Figure 32: Excerpt from the last folio in figure 3 showing usage of final consonant mark in Tibetan text. Here, its usage departs from its normative behavior in marking syllable-final consonants and occurs after conjuncts and vowels, functioning more like a below-base 'tsheg than a final-consonant mark. For example it occurs with bla (first syllable), yi (third syllable), kyi (ninth syllable), among others. Agata Bareja-Starzyńska suggests that text (a Tibetan prayer) may have been added to the manuscript by another scribe, who did not fully know the Zanabazar Square script, as the usage of final consonant mark here differs from that of the primary text of the original author.
Figure 33: Manuscript excerpt showing usage of the ◌ FINAL CONSONANT MARK with ◌ SMALL A for indicating word-final ◌ ’a (from Byambaa Ragchaagiin 2005: 51).

Figure 34: A seal showing the variant form ◌ of ◌ FINAL CONSONANT MARK for representing the Mongolian final consonant ng: ◌ for ◌ (from Byambaa Ragchaagiin 2005: 60).
Figure 35: Portion containing Zanabazar Square text from figure 8 showing usage of the variant form 𭚩 for 𭚨 SMALL A in the words 𭚨𭚩 pa’i and 𭚨𭚪 ’bri. Details courtesy of Agata Bareja-Starzyńska.

Figure 36: Zanabazar Square document showing the word thalīṃ written vertically with 𭢙, the reversed form of 𭚨 SMALL A; see also figure 22 (from Byambaa Ragchaagiin 2005: 97).

Figure 37: Excerpt of the second folio from figure 5 showing the sequence “ཨཱ ཞཱ” dza dzha va . da dha . in the traditional arrangement of the script. Note the appearance of “ཨཱ” <VA, SHAD> as ཨཱ and “ཨཱ” <DHA, SHAD> as ཨཱ.
Figure 38: Manuscript showing the variant form 𭰢 of 𭰢 va in the phrase नमः सत्यं प्रकटितं हा नु va śa va ra hi svā hā (from Byambaa Ragchaagiin 2005: 98). Note the variant form 𑫱 of 𑫱 VOWEL SIGN U in 𑫱 nu and the variant form 𑫱 of the subjoined form 𑫱 of 𭰢 va in the conjunct 𑫱 svā.

Figure 39: Manuscript showing the word 𑭠𑭠 svaḥ (svāhā) written with the conjunct 𑭠 sba (from Byambaa Ragchaagiin 2005: 98).
Figure 40: Variations of the 𗨩 INITIAL HEAD MARK written as a bare mark as well as with various ornaments. See section 4.11 for details.
Figure 41: Manuscript showing usage of the head mark 𞊘 (from Byambaa Ragchaagiin 2005: 97). This mark corresponds to the Tibetan །༅. For purposes of the encoding, it is considered a glyphic variant of 陟 and is to be produced using <陟 INITIAL HEAD MARK, 陟 CLOSING HEAD MARK>. Note also the usage of the 陟 LONG TSHEG, corresponding to the Tibetan ง mark.

Figure 42: Two manuscript excerpts showing elongation of the ◊ VOWEL SIGN AI at the end of a text (top from Bareja-Starzyńska and Ragcha 2012; bottom from Byambaa 2005: 87). In both excerpts, elongation occurs in the Mongolian word boltugai “let it be”, which is written at top as 耐囘 boltoqai and at bottom as 耐囘 baltugai. This form of VOWEL SIGN AI is a stylistic variation. Details provided by Agata Bareja-Starzyńska.
Figure 43: Mongolian diphthongs (from Byambaa Ragchaagiin 2005: 85). Shown in red is \( \text{ᠥᠤ} \) kūi; in blue is \( \text{ᠥᠤ} \) kui; in black is \( \text{ᠥᠤ} \) gei; in green is \( \text{ᠥᠤ} \) loi. See section 4.4 for details on the representation of these diphthongs. Note also the use of the variant form \( \text{ᠥ} \) for \( \text{ᠥ} \) VOWEL SIGN A1.

Figure 44: The Mongolian diphthong \( \text{ᠥᠤ} \) in \( \text{ᠥᠤ} \) theū (from Byambaa Ragchaagiin 2005: 86).

Figure 45: The Mongolian diphthong \( \text{ᠥᠤ} \) in \( \text{ᠥᠤ} \) gēi (from Bareja-Starzyńska and Ragcha 2012).
Figure 46: Detail of the specimen in figure 8 showing usage of ’tsheg for marking syllabic boundaries in the sentence ལོ་གདུ་གྱེ་བཟད་དུ། ། sog pa’i yi ge sva yam bhu jyo ti ’bri tshul bzhugs so.

Figure 47: Detail of a folio showing usage of ’tsheg for marking syllabic boundaries in the Zanabazar Square phrase ཤྱ་གསངས། rgya gar skad du (from Byambaa Ragchaagiin 2005: 107).
Figure 48: Folio showing usage of a variant form of \( \circ \) VOWEL SIGN AI used for writing \( \text{mai} \) (from Byambaa Ragchaagiin 2005: 113).

Figure 49: Folio showing usage of a variant form of \( \circ \) VOWEL SIGN AU used for writing \( \text{trau} \) (from Byambaa Ragchaagiin 2005: 113).

### 8. Additional Information:

Submitters are invited to provide any additional information about Properties of the proposed Character(s) or Script that will assist in correct understanding of and correct linguistic processing of the proposed character(s) or script. Examples of such properties are: Casing information, Numeric information, Currency information, Display behaviour information such as line breaks, widths etc., Combining behaviour, Spacing behaviour, Directional behaviour, Default Collation behaviour, relevance in Mark Up contexts, Compatibility equivalence and other Unicode normalization related information. See the Unicode standard at [http://www.unicode.org](http://www.unicode.org) for such information on other scripts. Also see Unicode Character Database ([http://www.unicode.org/reports/tr44/](http://www.unicode.org/reports/tr44/)) and associated Unicode Technical Reports for information needed for consideration by the Unicode Technical Committee for inclusion in the Unicode Standard.
C. Technical - Justification

<table>
<thead>
<tr>
<th>Question</th>
<th>Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Has this proposal for addition of character(s) been submitted before?</td>
<td>Yes</td>
</tr>
<tr>
<td>If YES explain: Complete revision of N4471 L2/13-198; see “Introduction” for list of major changes.</td>
<td></td>
</tr>
<tr>
<td>2. Has contact been made to members of the user community (for example: National Body, user groups of the script or characters, other experts, etc.)?</td>
<td>Yes</td>
</tr>
<tr>
<td>If YES, with whom? Agata Bareja-Starzyńska (University of Warsaw, Poland)</td>
<td></td>
</tr>
<tr>
<td>If YES, available relevant documents:</td>
<td></td>
</tr>
<tr>
<td>3. Information on the user community for the proposed characters (for example: size, demographics, information technology use, or publishing use) is included?</td>
<td>Yes</td>
</tr>
<tr>
<td>Reference:</td>
<td></td>
</tr>
<tr>
<td>4. The context of use for the proposed characters (type of use: common or rare)</td>
<td>Rare</td>
</tr>
<tr>
<td>Reference:</td>
<td></td>
</tr>
<tr>
<td>5. Are the proposed characters in current use by the user community?</td>
<td>Yes</td>
</tr>
<tr>
<td>If YES, where? Reference: By scholars of Mongolian culture, history, and linguistics</td>
<td></td>
</tr>
<tr>
<td>6. After giving due considerations to the principles in the P&amp;P document must the proposed characters be entirely in the BMP?</td>
<td>N/A</td>
</tr>
<tr>
<td>If YES, is a rationale provided?</td>
<td></td>
</tr>
<tr>
<td>If YES, reference:</td>
<td></td>
</tr>
<tr>
<td>7. Should the proposed characters be kept together in a contiguous range (rather than being scattered)?</td>
<td>Yes</td>
</tr>
<tr>
<td>8. Can any of the proposed characters be considered a presentation form of an existing character or character sequence?</td>
<td>No</td>
</tr>
<tr>
<td>If YES, is a rationale for its inclusion provided?</td>
<td></td>
</tr>
<tr>
<td>If YES, reference:</td>
<td></td>
</tr>
<tr>
<td>9. Can any of the proposed characters be encoded using a composed character sequence of either existing characters or other proposed characters?</td>
<td>No</td>
</tr>
<tr>
<td>If YES, is a rationale for its inclusion provided?</td>
<td></td>
</tr>
<tr>
<td>If YES, reference:</td>
<td></td>
</tr>
<tr>
<td>10. Can any of the proposed character(s) be considered to be similar (in appearance or function) to, or could be confused with, an existing character?</td>
<td>No</td>
</tr>
<tr>
<td>If YES, is a rationale for its inclusion provided?</td>
<td></td>
</tr>
<tr>
<td>If YES, reference:</td>
<td></td>
</tr>
<tr>
<td>11. Does the proposal include use of combining characters and/or use of composite sequences?</td>
<td>Yes</td>
</tr>
<tr>
<td>If YES, is a rationale for such use provided?</td>
<td>Yes</td>
</tr>
<tr>
<td>If YES, reference: Combining signs</td>
<td></td>
</tr>
<tr>
<td>Is a list of composite sequences and their corresponding glyph images (graphic symbols) provided?</td>
<td></td>
</tr>
<tr>
<td>If YES, reference:</td>
<td></td>
</tr>
<tr>
<td>12. Does the proposal contain characters with any special properties such as control function or similar semantics?</td>
<td>Yes</td>
</tr>
<tr>
<td>If YES, describe in detail (include attachment if necessary) Virama see text of the proposal</td>
<td></td>
</tr>
<tr>
<td>13. Does the proposal contain any Ideographic compatibility characters?</td>
<td>No</td>
</tr>
<tr>
<td>If YES, are the equivalent corresponding unified ideographic characters identified?</td>
<td></td>
</tr>
<tr>
<td>If YES, reference:</td>
<td></td>
</tr>
