Re:      Remove SL, SA, ML  data values from UAX #39
From:   Mark Davis
Date:    2014-09-26

The use of the data for SL, SA, ML is discouraged in #39. Their use is dangerous for a number of reasons, as we found out during the development of v7.0 of #39. I recommend that we put out a PRI to remove those tables from v8.0 of UTS#39.

The removal would involve:

1.   Removing any line containing the values {SL, SA, ML} as the third field value in confusables.txt
     a.   For compatibility, we could retain the third field in the file, but the value would always be MA.
2.   Modifying ConfusableDataTableTypes
3.   Making the necessary other changes in the text of #39.

It has the other advantage of making the data file about ¼ the length, and easier to read. (L2014/14151)

Note that these values can be derived from the MA tables (plus UCD properties for script, normalization, and casing) if someone wanted to construct their own for some reason.
