Revised designs of the alchemical symbols block

Kirk Miller, kirkmiller at gmail.com
2023 November 5

The designs of the Alchemical Symbols block could be improved. The current Unicode designs are taken from Newton’s manuscripts, but most of the symbols are not unique to Newton. They have great variations in other sources, and Newton’s forms are not always representative. I am therefore proposing a new font for the entire alchemical symbols block, with more generic and often simpler designs extrapolated from several historical sources. The designs have been reviewed by William Newman, lead author of L2/09-037 Proposal for Alchemical Symbols in Unicode, and others at the Chymistry of Isaac Newton Project at Indiana University. Non-alphabetic characters are styled to conform with Denis Moskowitz’s designs of the dwarf-planets (1F77B–1F77F) and are based on those and on his designs for other planetary symbols. Alphabetic ligatures are built from the Open Sans font.

Thanks to Deborah Anderson of the Universal Scripts Project for her assistance.

Chart

Characters on a blue background have significant changes from the current Unicode font and are illustrated in the figures. Characters built from the Open Sans font are set at a relatively small size to prevent them from displaying with a spuriously heavy line weight, but that smaller size is not prescriptive and should not be taken as a model for a Unicode font.

Figures

Justification for notable changes is presented here.

Metal ores

The ore symbols derive from the planetary symbols for the metal plus a ring. The location of the ring is arbitrary. 🜡 is a conflation of U+1F71C 🜡 IRON ORE (Mars for iron plus a ring) and U+1F720 🜠 COPPER ORE (Venus for copper plus a ring). 🜾 BISMUTH ORE is a trident for bismuth plus a ring; this alchemical trident symbol is not supported separately by Unicode. Advisors at the Chymistry Project have reviewed the font and confirmed that the designs are acceptable.

Figure 1. List of symbols from the Chymistry Project. The placement of the ring varies.

1F741 ⚤ QUICKLIME

The middle tine is variable (as long as the other two, shorter or even absent), but the symbol derives from a three-tined symbol for calx (not supported by Unicode) plus a cross. It may thus be identical to the planetary symbol for Neptune, U+2646 ⚤, and the same glyph is used here for both. However, while the symbol for Neptune may also have a short middle tine, it may have a planetary orb rather than a cross at the bottom, or arrow heads on the tines; neither are possibilities in the symbol for quicklime.

1F747 ⊑ SPIRIT

Occasionally a disambiguating dot may be placed inside this symbol, or an sp adjacent to it, but the request of the Chymistry Project was that the minimal form be the Unicode default.

Figure 11. Le Febvre.

Figure 12. Valentine. An allograph with a dot to distinguish it from sublimation, which appears in this source without its bottom stroke.

**1F749ULLET GUM**

Sources such as De Rosemont render this symbol as a simple printed ligature, $S^S$, and alphabetize it among the esses. Others show a manuscript form closer to current Unicode.

Figure 13. De Rosemont.

Figure 14. Valentine.

Figure 15. Le Febvre.

**1F74C-cross CALX**

The current Unicode design is simply the Latin letter C. The symbol may have an additional element such as the cross shewn here.

Figure 16. Valentine. At center is a C+ form. The character at left is the calx that forms the top part of U+1F741 $\mathcal{U}$ QUICKLIME (calx viva).

Figure 17. *Encyclopédie*, plate IV.
1F74F ⚫ SCEPTER OF JOVE

This character was changed at the request of the Chymistry Project. The vertical stroke should be straight, as there are only two bolts of lightning. As Newman explained it, “This is supposed to be a vertical rod with crossed thunderbolts, modeled on the Caduceus of Mercury, but substituting the said lightning bolts for the snakes. The rod should be straight.”

![Scepter of Jove](image1)

Figure 18. The sole example of the symbol, in Newton’s manuscript.

1F756 ⦅ HORSE DUNG

This symbol displays a wide variety of forms. The one selected is simple and symmetrical.

![Horse Dung](image2)

Figure 19. Valentine. The Latin here is *fimus equinus*.

1F758 ⦈ POT ASHES

The current Unicode design has a stroke at bottom, but a cross appears to be more usual. Occasionally there is a third tine, like ⦈ U+1F757 ASHES rotated 90 degrees.

![POT ASHES](image3)

Figure 20. Valentine. The Latin here is *cineres clavellati*.

Figure 22. Charas.
Any mineral salt containing high levels of potassium. Potash is extracted from the boiled ashes of vegetable waste and used in soap manufacture, textile bleaching, and glassmaking. From Dutch pot- aschen, "ashes in a pot."

---

1F763 ⪫ PURIFY

This is the descending node, U+260B ⪫, one of several astronomical symbols used in alchemy. (The ascending node, U+260A ⪬, is used for sublimation, synonym to Libra, ∪ U+264E/U+1F75E.)
1F768 🝨 CRUCIBLE-4

This varies between a simple Latin T (an abbreviation of tigillum), a cross + (from the root crux in crucibulum), and an intermediate combined form, T with a stroke. The intermediate form was selected.
