## 1 Introduction

This is a proposal to encode the Proto-Elamite script in Unicode. It supersedes the following document:

- L2/20-192: “Preliminary proposal to encode Proto-Elamite in Unicode”

Major updates to the previous proposal include:

- Detailed tabulation of Proto-Elamite signs from various CDLI sources
- Descriptions of additional signs to be added to the tentative Unicode repertoire
- Expanded details about ‘hapax’ signs (see § 5.6)
- Summary of signs with possible alternate forms (see § 8.9)
- Inclusion of two fragmentary signs that were previously excluded:  M4-x and  M136 + Mxxx
- Usage of a TrueType font instead of EPS images for representing signs
- Inclusion of Unicode character and linebreaking properties (see § 7)
- Enumeration of several questions for experts regarding the repertoire (see § 3)

## 2 Approach to the Encoding

Proto-Elamite is one of the oldest attested writing systems in the world. The signs are well documented, but the writing system has not yet been completely deciphered. However, there are ongoing attempts to decipher it. Sign lists have been refined over time, and several signs that were separately enumerated in early sign lists have been merged. The working sign list maintained by the Cuneiform Digital Library Initiative (CDLI) is stable and is based on intensive analysis of signs that occur in all extant tablets. But, understandably, there is no known ‘standard’ for Proto-Elamite, although there may have been one that governed usage of the system five thousand years ago in Elam.

Scholars continue to study Proto-Elamite and offer new publications that enhance our knowledge of it. Proto-Elamite signs are represented in these publications using catalogue identifiers, as is the typical convention for other ancient and undeciphered writing systems. This convention is born from practicality: it is far easier to refer to an alphanumeric identifier than to refer to images of signs, whose reproduction may be imprecise and dependent entirely upon technical resources. In the past few decades, in-line images of signs have been used in the scholarly literature to supplement sign names. The CDLI has made available high-quality images of more than 1,600 Proto-Elamite signs, which are used in digital reproductions of sources. Current scholars of Proto-Elamite have expressed an interest in advancing such representations of the script in digital publications and reproductions of textual records. Laura Hawkins, one of the foremost experts of Proto-Elamite today, states that the “form of the signs is very relevant to our understanding of the semantics of the sign, so it would be extremely useful to refer to individual signs and strings of signs in-line in texts” (personal correspondence, August 2020).

The first step in this process of making signs available for use in plain text is to include Proto-Elamite in the Unicode standard. But, there are two schools of thought regarding the encoding of undeciphered scripts, such as Proto-Elamite, in Unicode:

- Keep waiting until the writing system is fully deciphered, if ever, then include in Unicode
- Encode the attested repertoire of signs, so that the script as known today can be used digitally

Of the above, the second point is most practical and sensible, and meets the immediate needs of modern users of Proto-Elamite. To meet that goal, I have developed a tentative Unicode repertoire for Proto-Elamite with the following characteristics:

- The core repertoire consists of the 1636 unique signs introduced in L2/20-192, for which CDLI images are available. For Unicode, it is essential to have representative or normalized glyphs for distinctive characters in addition to unique character names
- Potential extension of the core repertoire with nearly 350 additional distinctive signs, which are referenced in other CDLI resources, namely the transliterations of the extant corpus. I do not know if images exist of these signs.
- Usage of the CDLI sign name for the Unicode characters, with the intent of maintaining alignment between Unicode and long-standing scholarly naming conventions. There is a precedent of using of catalogue identifiers for character names for both ancient and undeciphered scripts in Unicode, eg. Egyptian Hieroglyphs, Cypro-Minoan, Linear A, Sidetic (see Pandey 2023), etc.

The fact that Proto-Elamite has not been completely deciphered is not an obstacle to including it in Unicode. The outcomes of any future efforts to refine the sign repertoire or to decipher the script would have little impact on the basic aspects of the Unicode encoding. If new signs are discovered, they may be added to the Unicode repertoire. If specific values for signs are determined in the future, these may be added as annotations in the Unicode names list. If a sign is later merged with another or deemed a variant, then an annotation regarding this information may also be added to the names list. Changes resulting from future sign-list refinement or decipherment exercises will not likely change the fact that users will continue to refer to Proto-Elamite signs using existing naming conventions for purposes of consistency across the existing literature.

In fact, encoding all signs documented at present will elevate the technical resources for advancing research of the writing system, and may open new avenues for decipherment. But, more practically, it will enable scholars to represent the known repertoire in both published and digital materials, and to leverage programmatic techniques for analyzing and processing signs as actual characters.

## 2.1 Sources and Methodology

Several sign lists have been created since the first publication of the Susa tablets by Scheil in 1905. The lists provided by Scheil, de Mecquenem (1949), Meriggi (1971) are problematic for various reasons, as discussed by Englund (2011) and Dahl (2015). These sign inventories were largely inaccurate due to the inclusion of signs from systems, such as Proto-Cuneiform and Linear Elamite, and the lack of careful classification of graphical and semantic variants. As a result, these sign lists enumerate a wide range of signs, from 5,529 signs by de Mecquenem to 393 by Meriggi.

In the past few decades, knowledge about Proto-Elamite has improved through graphemic and graphotactical analysis, and advanced comparative studies of cuneiform tablet structures. Much of this work has been performed by the Cuneiform Digital Library Initiative (CDLI), and has led to the creation of a modern sign list. The new inventory of signs is maintained by Dahl and the researchers at CDLI. Their meticulous efforts have also generated several digital resources that can be used to analyze and quantify Proto-Elamite signs.

The first step in determining the shape of a Unicode repertoire for Proto-Elamite is to assess all of the signs that are documented in modern sources, namely those maintained by CDLI. For this purpose, I have

extensively relied on the following CDLI resources, which are referred to throughout this document using the abbreviation in the ‘ID’ column.

Source	ID	Sign Count
CDLI: Proto-Elamite signs in EPS format <a href="https://cdli.ucla.edu/tools/cdlifiles/prE_signs.zip">https://cdli.ucla.edu/tools/cdlifiles/prE_signs.zip</a>	EPS	1636
CDLI: Proto-Elamite signs in EPS format <a href="https://github.com/cdli-gh/proto-elamite_data">https://github.com/cdli-gh/proto-elamite_data</a>	EPS-GH	1332
CDLI: Dahl’s working sign list in PDF, 2006-06-28 <a href="https://cdli.ucla.edu/tools/cdlifiles/signlists/prE_signlist.zip">https://cdli.ucla.edu/tools/cdlifiles/signlists/prE_signlist.zip</a>	PDF	1434
CDLI: Proto-Elamite sign list in JSON <a href="https://cdli.mpiwg-berlin.mpg.de/resources/token-lists/5/signs.json">https://cdli.mpiwg-berlin.mpg.de/resources/token-lists/5/signs.json</a>	JSON	1796
CDLI: Proto-Elamite word list in JSON <a href="https://cdli.mpiwg-berlin.mpg.de/resources/token-lists/5/words.json">https://cdli.mpiwg-berlin.mpg.de/resources/token-lists/5/words.json</a>	JSON-words	1796
CDLI: Proto-Elamite transliterations, 2011-11-20 <a href="https://cdli.ucla.edu/tools/cdlifiles/protoElamTranslits20111120.zip">https://cdli.ucla.edu/tools/cdlifiles/protoElamTranslits20111120.zip</a>	Corpus	1741
SFU: Proto-Elamite transliterations, 2018-06-02 <a href="https://github.com/sfu-natlang/pe-decipher-toolkit/blob/master/data/cdli_atf_20180602.txt.bz2">https://github.com/sfu-natlang/pe-decipher-toolkit/blob/master/data/cdli_atf_20180602.txt.bz2</a>	Corpus-SFU	1741

I have collated all signs available in these sources, and conducted a comparative analysis of their intersections and differences (see § 8 for all details).

Major overviews of the sources are as follows:

- Only EPS, EPS-GH, PDF have sign images as well as sign names
- JSON, JSON-words, Corpus, Corpus-SFU have only sign names
- JSON and JSON-words have the same set of signs
- Corpus and Corpus-SFU have the same set of signs, despite different timestamp in filenames
- Images in EPS-GH are identical to EPS, but EPS has numeric signs not in EPS-GH
- PDF lacks numeric signs, and has signs not found in EPS, but lacks images for those

The distinctive sources are EPS, PDF, JSON, and Corpus. These sources have a total of 6607 raw sign names, of which 2011 are distinctive. A comparison of intersections of unique signs between these sources is shown below:

	EPS (1636)	PDF (1434)	JSON (1795)	Corpus (1741)
EPS (1636)		1374	1469	1470
PDF (1434)	1374		1338	1349
JSON (1795)	1469	1338		1716
Corpus (1741)	1470	1349	1716	

While there is substantial overlap in the set of signs enumerated across the sources, there are also considerable differences.

## 2.2 Establishing the base repertoire

The tentative repertoire is based on EPS, which contains 1636 signs, and provides a set of representative sign images. Accordingly, the names for signs in the repertoire are based on the EPS filenames. The repertoire along with sign glyphs and proposed Unicode names is provided in § 6.

## 2.3 Potential additions to the repertoire

This core repertoire may be expanded by including the following 348 signs:

- 328 additional signs referenced in sign lists
- 14 unique signs, which occur in compounds, but are not itemized separately in sign lists
- 6 unique signs that are occur in names of variant signs, but are not itemized separately in sign lists

These extra signs are enumerated below. They have not been added to the tentative repertoire. Additional refinements are likely to be needed. Also, images of these signs are not yet available.

### 2.3.1 Independent signs attested beyond the base

There are 375 total signs in PDF, JSON, Corpus that are not found in EPS. In many cases, a given sign may be named differently across the sources, and may be merged using the EPS sign name. There are also some signs in these sources, such as placeholders for fragmentary or missing signs, which may also be excluded.

Normalization of names results in 328 distinctive signs, which are listed below. It is likely that further analysis will identify other signs that may be merged. The full list of signs not in EPS is provided in § 8.7, while a summary of mergers and exclusions follows in § 8.8.

1(N08)	2(N39~b)	4(N14@b)	7(N51)	M039~h
1(N08b)	2(N45)	4(N14@c)	8(N34)	M039~m
1(N14B)	2(N46)	4(N23)	8(N51)	M040

M210~e1	M296~a	M338	M370~b+X	X+M131
M210~n	M297+X	M338~a	M371~f	X+M383+X
M214	M297@b	M338~b	M373~b	
M217~b	M297~c	M338~c	M375~ia	

### 2.3.2 Signs in compounds, not independently itemized

There are 18 signs that occur in compounds listed in the available sources, but which are not independently enumerated in sign lists. See § 5.6 for details on ‘hapax’ signs in EPS.

1(N30D)~1	M038	M111~j	M237	M317#
M006~a	M039~ca	M127	M260~2	M600
M009~d	M106~2	M136~x	M265~b	
M024~c	M111~j	M218~d	M288~1	

### 2.3.3 Variant signs

There are 175 signs that are tagged as alternate or variant forms of 105 main signs across all sources (see § 8.9 for a full list). There are variants that refer to 7 main forms, which are not independently enumerated in sign lists.

M111~j	M195+M057~a	M260+X	M297~c
M139~a	M260+M313~a	M269~j	

As noted in § 2.3.2, M111~j occurs as a ‘hapax’ in compounds, as well.

## 3 Next Steps

Feedback on the issues below is requested for further developing the Unicode encoding for Proto-Elamite:

1. *Scope of the character repertoire*: The base repertoire consists of 1636 signs for which CDLI has provided images. Which of the additional 337 signs should be included in the Unicode repertoire?
2. *Sign images for additional signs*: Are images available for the additional 337 signs?
3. *Scribal designs*: Is more information available on scribal designs found on tablets (see § 5.8)?
4. *Additional sources*: Apart from the sign lists and transliterated corpora analyzed here (see § 2), are there other records that may be analyzed to identify additional signs for the tentative repertoire?
5. *New signs*: Have any new signs been identified since 2020, when the preliminary proposal was submitted?
6. *Reconciliation of sign names*: Different sign lists use different naming conventions for some signs, primarily for signs with modifiers. For example, EPS refers to ☒ as M139~a1 and ☒ as M139~a2, but PDF identifies them as M139~a and M139~b. For these types of name differences, which convention should be used?
7. *Handling of ‘hapax’ signs*: There are 18 signs that occur as named components of compounds and 7 signs that are referenced in names of sign variants. However, these are not enumerated independently in sign lists. Should they be included as separate characters in the Unicode repertoire?
8. *Sign images*: Apart from the 1636 signs currently available in EPS format, have images been created for other signs that are occur in the corpus?
9. *Unicode character names*: Should Unicode character names include leading zeros following the ‘M’ and ‘N’ prefixes, or should they be removed, for example: M001 or M1, M054 or M54; ONE-N01 or ONE-N1?
10. *Sort order for sign modifiers*: What is the preferred collation pattern for sign modifiers, such as ~a, ~b, ~1, ~2, etc. As ~1, ~2, etc. are used for indicating alternate forms, should they follow ~a, ~b. Example:

A: M112, M112~1, M112~a, M112~aa, M112~b, ... M112~p, M112~q, M112~r

B: M112, M112~a, M112~aa, M112~b, ... M112~p, M112~q, M112~r, M112~1

11. *Sort order for compounds:* Should compounds be interleaved with the base sign (along with sign modifiers) or placed after the base sign, eg.

A: M054, M054+M365+M054~i, M054+M384~i+M054~i, M054+M393~f+M054~i, M054~b, M054~c, M054~i

B: M054, M054~b, M054~c, M054~i, M054+M365+M054~i, M054+M384~i+M054~i, M054+M393~f+M054~i

Another option would be to group all compound signs after the set of individual base signs.

12. *Validation of sign names:* The sign ፩ is given the designation M036+1(N30C)+1(N39C). Is there an order of precedence for complex-capacity signs based on constituents rather than ‘vertical’ order? Visually, ፩ could be M036+1(N39C)+1(N30C).

## 4 Background

The term ‘Proto-Elamite’ refers to a writing system that was used at the beginning of the 3rd millennium BCE in the region to the east and southeast of Mesopotamia, known as Elam, which corresponds to the eastern portion of present-day Iran. The name was assigned by the French epigraphist Jean-Vincent Scheil in the early 20th century, who believed it to be the predecessor of a ‘proper’ Elamite script, which would have been used for recording the Elamite language, simply on account of the location of the tablets at Susa, which was the capital city of Elam. While no ‘proper’ descendant of the script has been identified, scholars continue to use the name ‘Proto-Elamite’ as a matter of convention (Dahl 2012: 2).

Proto-Elamite is believed to have been developed from an accounting system used in Mesopotamia, in a manner similar to the development of ‘Proto-Cuneiform’. The two systems likely emerged in parallel from the source, a hypothesis that is supported by the similarity of numerical signs and some signs that likely represent animals. But, both writing systems developed independently and uniquely. For instance, Proto-Elamite has signs for decimal notation that do not exist in Proto-Cuneiform. The two also differ in the glyptic nature of their ideographic signs: Proto-Cuneiform is highly pictographic, while Proto-Elamite is highly abstract. It is noteworthy that Proto-Cuneiform has an abundance of signs depicting human body parts, but such signs are absent from Proto-Elamite.

It is attested on approximately 1,600 records. The bulk of these are 1,400 well-preserved clay tablets that were unearthed at Susa in the early 20th century. These are supplemented by nearly 500 fragmentary tablets. Other Proto-Elamite records have been found across Iran, as far west as Baluchistan. The majority of the records are held by the Musée du Louvre (Paris) and the National Iranian Museum (Tehran). Based upon the structure of the contents and the appearance of numerical notation on the vast majority of tablets, scholars believe that the texts seem “without exception to be administrative documents”, recording “receipts and transfers of grain, livestock, and laborers” and other accounting details (Englund 2011).

Proto-Elamite has not been fully deciphered and the underlying language is unknown. The character repertoire contains numerical and ideographic signs. Numerical signs have been distinguished and their values have been understood based upon comparisons with Proto-Cuneiform signs. The value of several ideographic signs have been postulated using similar analogues in Proto-Cuneiform. It is believed that some signs may have been assigned syllabic values and used for representing proper names. This development is “unparalleled in the history of early writing systems” (Dahl 2012: 2).

During the French excavation at Susa, an object bearing an inscription in another script was found alongside the Proto-Elamite tablets. Scheil considered the records to be contemporary and to be part of the same

writing system (Vallatt 1986). It was eventually discovered that these records were inscribed in another writing system, which was used at the end of the 3rd millennium BCE. Modern scholars refer to this script as ‘Linear Elamite’ and consider the two scripts to be unrelated. Some believe that Linear Elamite signs have syllabic values, while some are logographic (Salvini 2011). Others propose that it is phonographic (Desset 2012). In August 2022, a team led by François Desset published a proposed decipherment of Linear Elamite (Desset, et al, 2022), which is being examined by experts.

Scholarship on Proto-Elamite is quite active and substantial efforts have been made to advance preservation of records, decipherment of the script, and to make materials available for study:

- The Cuneiform Digital Library Initiative (CDLI) is a collaboration by the University of California, Los Angeles, the University of Oxford, and the Max Planck Institute for the History of Science, Berlin focused on the study of ancient Near Eastern writing systems. It provides access to high-resolution images and transliterations of all extant Proto-Elamite records.
- A joint effort by the University of Oxford and the University of Southampton in 2012 used Reflectance Transformation Imaging (RTI) to produce high-resolution images of more than one thousand Proto-Elamite tablets in the collections of the Louvre (see fig. 1; also Ronan 2013).
- In 2019, a team from the University of British Columbia began using natural language processing and machine learning techniques to perform graphotactical analysis in an effort to reveal previously-unobserved relationships between signs (Born, et al. 2019).

Proto-Elamite signs are depicted extensively in charts, but are generally referred to in running text using Latin alpha-numeric designations. This is a consequence both of the scholarly conventions used in the early 20th century and typographical limitations. The designations reference serial numbers used in sign lists. These are not descriptive and do not provide any meaningful context linked to the graphical aspects of a sign. This alphanumeric identifier was used instead of the actual sign due to the technical convenience of typesetting Latin characters and also to the lack of proper Proto-Elamite fonts. However, as digital typography tools became more prevalent, scholars developed digitized fonts for Proto-Elamite signs and used them in running text in publications (see fig. 5–7).

A Unicode encoding would provide scholars of Proto-Elamite with a digital foundation for advancing the study and decipherment of the script, and preservation and exchange of the corpus, using data-driven approaches.

## 5 Overview of the Sign Repertoire

### 5.1 Sign names

- Numeric signs are denoted using a number followed by ‘N’. The number preceding ‘N’ indicates the value of the sign, and the number following ‘N’ refers to a decipherment sequence, not to any inherent value of the sign.
- Ideographic sign names begin with ‘M’ and are numbered serially. These may carry a variety of alphanumerical suffixes that indicate different graphical attributions
- Names for both numeric and ideographic signs may contain a ‘@’, ‘#’, which indicate modifications to the base sign, such as a rotated element, etc.
- Compound signs are indicated by linking the constituent elements using the ‘+’ sign. This system is not intended to convey the actual structure of the compound, but simply to describe the membership of the compound.

### 5.2 Numeric signs

The numeric signs are used for recording decimal and sexagesimal notations. There is no distinctive sign for zero. Signs used for expressing singular values are shown below:

	1N <sub>1</sub>		1N <sub>23</sub>		1N <sub>39a</sub>		1N <sub>51</sub>
	1N <sub>2</sub>		1N <sub>24</sub>		1N <sub>39b</sub>		1N <sub>51g</sub>
	1N <sub>8a</sub>		1N <sub>30c</sub>		1N <sub>39c</sub>		1N <sub>54</sub>
	1N <sub>8b</sub>		1N <sub>30d</sub>		1N <sub>45</sub>		
	1N <sub>14</sub>		1N <sub>34</sub>		1N <sub>48</sub>		

The signs 1N<sub>1</sub> and 1N<sub>14</sub> have attested representations of the primary units of the decimal system. It appears that 1N<sub>1</sub> could have been used for decimal notation, but only two units are attested.

1N <sub>1</sub>	2N <sub>1</sub>	3N <sub>1</sub>	4N <sub>1</sub>	5N <sub>1</sub>	6N <sub>1</sub>	7N <sub>1</sub>	8N <sub>1</sub>	9N <sub>1</sub>
1N <sub>14</sub>	2N <sub>14</sub>	3N <sub>14</sub>	4N <sub>14</sub>	5N <sub>14</sub>	6N <sub>14</sub>	7N <sub>14</sub>	8N <sub>14</sub>	9N <sub>14</sub>
1N <sub>30c</sub>	2N <sub>30c</sub>							

### 5.3 Numeric signs with extended representations

Some numeric signs have ‘enclosed’ and ‘hatched’ forms:

base sign	enclosed	hatched
⌚ 1N <sub>1</sub>	⌚⌚ 1N <sub>1@b</sub>	⌚⌚ 1N <sub>1@c</sub>
● 1N <sub>14</sub>	⌚⌚ 1N <sub>14@b</sub>	⌚⌚ 1N <sub>14@c</sub>
⌚⌚ 1N <sub>24</sub>	⌚⌚ 1N <sub>24@b</sub>	⌚⌚ 1N <sub>24@c</sub>
⌚⌚⌚⌚ 1N <sub>30c</sub>	⌚⌚⌚⌚ 1N <sub>30c@b</sub>	⌚⌚⌚⌚ 1N <sub>30c@c</sub>
⌚⌚⌚⌚ 1N <sub>30d</sub>	⌚⌚⌚⌚ 1N <sub>30d@b</sub>	⌚⌚⌚⌚ 1N <sub>30d@c</sub>
⌚⌚⌚⌚ 1N <sub>34</sub>	⌚⌚⌚⌚ 1N <sub>34@b</sub>	unattested
⌚⌚⌚⌚ 1N <sub>39b</sub>	⌚⌚⌚⌚ 1N <sub>39b@b</sub>	⌚⌚⌚⌚ 1N <sub>39b@c</sub>
● 1N <sub>45</sub>	⌚⌚⌚⌚ 1N <sub>45@b</sub>	unattested
⌚⌚⌚⌚ 1N <sub>51</sub>	⌚⌚⌚⌚ 1N <sub>51@b</sub>	⌚⌚⌚⌚ 1N <sub>51@c</sub>
⌚⌚⌚⌚ 3N <sub>1</sub>	⌚⌚⌚⌚ 3N <sub>1@b</sub>	⌚⌚⌚⌚ 3N <sub>1@c</sub>

### 5.4 Complex capacity signs

A ‘complex capacity sign’ (CCS) is used for counted objects, such as jars, pots, etc. Such a sign is formed by inscribing a numerical sign (N) within the frame of a non-numeric (G) sign. The numerical sign may be accompanied by another numeric sign or a non-numeric (G) sign. The pattern for CCS may be expressed as G×(G|N(+G|N)\*). According to Dahl, when a CCS base (G) is inscribed with a numerical sign, it likely indicates a quantity of the product being expressed, and when inscribed with a non-numerical sign it likely indicates a quantity of the product. When inscribed with both types of signs, the compound represents both the quantity and the quality of the product. Common bases for CCS compounds are:

- ⌚⌚⌚⌚ M36, believed to represent a quantity of grain (Dahl 2015: 2)

- M39, believed to be an alternate representation of the container M36 (Dahl 2015: 4)
- M260, believed to represent a vessel for storing beer (Dahl 2015: 4)

Some attested CCS compounds are shown below, analyzed into subtypes based upon the the structures of the signs and patterns of compound formation. Generally, the inscribed signs are reduced in size in order to fit within the frame of the base.

- Container with a numerical sign, of the pattern G×N:

$$\square \text{---} M36 \times \bullet \quad 1N_{14} \rightarrow \boxed{\bullet}$$

$$\square \text{---} M36 \times \text{---} \bullet \quad 1N_{24} \rightarrow \boxed{\bullet}$$

$$\square \text{---} M36 \times \text{---} \square \quad 1N_{39b} \rightarrow \boxed{\square}$$

$$\square \text{---} M39 \times \text{---} \bullet \quad 1N_{30d} \rightarrow \boxed{\bullet}$$

$$\diamondsuit \text{---} M260 \times \bullet \quad 1N_{24} \rightarrow \boxed{\bullet}$$

$$\diamondsuit \text{---} M260 \times \text{---} \bullet \quad 1N_{24} \rightarrow \boxed{\bullet}$$

$$\diamondsuit \text{---} M260 \times \text{---} \bullet \quad 1N_{30c} \rightarrow \boxed{\bullet}$$

$$\diamondsuit \text{---} M264-a \times \text{---} \bullet \quad 1N_{24} \rightarrow \boxed{\bullet}$$

- Container with two numerical signs, of the pattern G×(N+N):

$$\square \text{---} M36 \times \text{---} \bullet \quad 1N_{39c} + \text{---} \bullet \quad 1N_{30c} \rightarrow \boxed{\bullet}$$

- Container with a numerical and non-numerical sign, of the pattern G×(N+G):

$$\square \text{---} M36 \times \text{---} \bullet \quad 1N_{24} + \text{---} \bullet \quad M343-h \rightarrow \boxed{\bullet}$$

$$\square \text{---} M36 \times \text{---} \bullet \quad 1N_{39b} + \text{---} \bullet \quad M343-h \rightarrow \boxed{\bullet}$$

- Container with a non-numerical sign, of the pattern G<sub>1</sub> × G<sub>2</sub>

 M260 ×  M266-A → 

 M260 ×  M312 → 

## 5.5 Complex graphemes

A ‘complex grapheme’ (CG) is used for inanimate objects, as well as persons, households, and other quantities. Dahl describes three types of CG, but I have analyzed CGs into additional subtypes based upon sign structures and patterns of compound formation:

- Type 1<sub>a</sub>: Two instances of one sign vertically framing another sign, following the pattern G<sub>1</sub> + G<sub>2</sub> + G<sub>1</sub>. Scaling or re-sizing of signs occurs with some compounds.

 M153 +  M320 +  M153 → 

 M377 +  M383 +  M377 → 

 M370 +  M386 +  M370 → 

 M387-CA +  M340 +  M387-CA → 

- Type 1<sub>b</sub>: A regular and inverse form of one sign vertically framing another sign, following the pattern G<sub>1</sub> + G<sub>2</sub> + G<sub>1i</sub>

 M54 +  M393-f +  M54-i → 

 M54 +  M384-i +  M54-i → 

- Type 2<sub>a</sub>: One sign inscribed within the main body of another sign, which typically has a frame or container structure, following the pattern G<sub>1</sub> × G<sub>2r</sub>. In such compounds, G<sub>2</sub> may be reduced in size.

 M36 ×  M10 → 

 M172 ×  M286 → 

 M201 ×  M377 → 

\* M217 ×  M124 → \*

- Type 2<sub>b</sub>: One sign inscribed within a specific field in of another sign, whose structure appears to be specifically formed to function as a complex grapheme; following the pattern G<sub>1</sub> × G<sub>2r</sub>. In such compounds, G<sub>2</sub> may be reduced in size.

 M327 ×  M320 → 

 M362 ×  M365 → 

- Type 2<sub>c</sub>: One sign inscribed a particular segment of another container-like sign, following the pattern G<sub>1</sub> × G<sub>2r</sub>. In such compounds, G<sub>2</sub> may be reduced in size.

 M96 ×  M29 → 

 M131 ×  M388 → 

 M153 ×  M106 → 

 M153 ×  M205-c → 

 M167-a ×  M131-k → 

- Type 2<sub>d</sub>: Two size-reduced forms of one sign vertically inscribed within another sign of Type 2<sub>a</sub>, following the pattern G<sub>1</sub> × (G<sub>2r</sub> + G<sub>2r</sub>)

 M201 ×  M377 +  M377 → 

- Type 3: linear adjacent, following the pattern G<sub>1</sub> + G<sub>2</sub> or G<sub>2</sub> + G<sub>1</sub>. This type may be an alternate method for representing the Type 2 compounds shown above.

\* M217 +  M124 → \* 

 M362 +  M365 →  

Apart from the above CGs described by Dahl (2015), the repertoire contains compound signs formed using the following methods:

- Vertical stacks of two signs, following the pattern G<sub>1</sub> + G<sub>2</sub>:

— M2 + M379 →

M343-H + M353 →

- Vertical stacks of the same sign, following the pattern G<sub>1</sub> + G<sub>1</sub>:

M304 + M304 →

M377 + M377 →

- A single sign with mirrored graphical components bifurcated vertically to frame another sign, with possible size adjustments of the latter, following the pattern G<sub>1t</sub> + G<sub>2</sub> + G<sub>1b</sub>

M348 + M4 →

M348 + M346 →

## 5.6 ‘Hapax’ signs

Of the 18 ‘hapax’ signs that occur in compounds across the sources (see § 2.3.2), but are not itemized separately in sign lists, 14 occur in EPS:

‘Hapax’	Occurrence
1(N30D)~1	M036+1(N30D)~1
M006~a	M153+M006~a
M009~d	M009~d+M346+M009~d
M024~c	M362+M024~c
M038	M195+M038
M039~ca	M039~ca+1(N30D)

'Hapax'	Occurrence
M111~j	●≡
M127	≡≡
M218~d	≡≡
M237	≡≡*
M260~2	≡≡
M265~b	≡≡
M288~1	≡≡
M317#	≡≡
	M386+M111~j
	M127+M127
	M218~d+M288
	M260~a+M237
	M260~2+1(N24)
	M317+M265~b
	M106+M288~1
	M362+M317#

Feedback from experts regarding these signs has been requested. It may be necessary to define these ‘hapax’ signs as individual signs in the tentative Unicode repertoire.

## 5.7 Alternate or variant forms

There are 153 signs that are tagged as alternate or variant forms of 86 signs.

Sign	Alternate
≡≡ M006@g	≡≡ M006@g~1, ≡≡ M006@g~2
≡≡ M010	≡≡ M010~1, ≡≡ M010~2, ≡≡ M010~3, ≡≡ M010~4, ≡≡ M010~5, ≡≡ M010~6, ≡≡ M010~7

## 5.8 Scribal designs

Signs referred to as ‘scribal designs’ are used in place of seals on some late Proto-Elamite tablets. There are 20 such scribal designs with 60 attestations (Dahl 2012: 4; see also the figure below). These scribal designs may be suitable for encoding on account of their semantics, but they are not included in the tentative repertoire at present.

## 6 Tentative Unicode Character Repertoire

The tentative encoded repertoire for Proto-Elamite consists of 1636 characters. There is a potential to expand this set with 337 additional signs. But, images for those signs are not currently available.

Of the 1636 signs with defined glyphs, 58 numeric and 1576 generic ideographic signs. The tables below provide a generic serial number for reference purposes, a digitized glyph, the CDLI name, and a proposed Unicode character name for each sign.

The ideographic signs may be categorized into 1374 individual and 204 compound signs. Of these, 182 are composed of 2 signs and 22 are composed of 3 signs. Compounds may be classified as ‘complex capacity signs’ and general ‘complex graphemes’, as per Dahl (2005), and are described in further detail in § 5.5 and § 5.4.

class	type	composition	total signs
numeric	individual sign	1 sign	58
ideographic	individual sign	1 sign	1374
	complex capacity sign (CCS)	2 signs	24
		3 signs	4
	complex grapheme (CG)	2 signs	158
		3 signs	18
			1636

### 6.1 Character Naming Convention

- The number preceding N in numerical signs has been replaced with its English name. Unicode character naming rules do not allow the character name to begin with a digit. A dash has been added between the number and the N in order to distinguish the sign’s value from other identifiers.
- Identifiers have been replaced with a descriptive term:

@b WITH ENCLOSURE  
 @c WITH HATCHING

- For ideographic signs, alphanumeric descriptors are denoted using a dash after the base sign name.
- The ‘+’ in sign names for compounds has been replaced with ‘AND’. No attempt to describe the actual structure of the compound within the character name has made been.

## 6.2 Numeric signs

The 58 numeric characters in the proposed repertoire are:

#	Sign	CDLI Name	Unicode Character Name
0		1(N01)	PROTO-ELAMITE NUMBER ONE-N1
1		1(N01@b)	PROTO-ELAMITE NUMBER ONE-N1 WITH ENCLOSURE
2		1(N01@c)	PROTO-ELAMITE NUMBER ONE-N1 WITH HATCHING
3		1(N02)	PROTO-ELAMITE NUMBER ONE-N2
4		1(N08A)	PROTO-ELAMITE NUMBER ONE-N8A
5		1(N08B)	PROTO-ELAMITE NUMBER ONE-N8B
6		1(N14)	PROTO-ELAMITE NUMBER ONE-N14
7		1(N14@b)	PROTO-ELAMITE NUMBER ONE-N14 WITH ENCLOSURE
8		1(N14@c)	PROTO-ELAMITE NUMBER ONE-N14 WITH HATCHING
9		1(N23)	PROTO-ELAMITE NUMBER ONE-N23
10		1(N24)	PROTO-ELAMITE NUMBER ONE-N24
11		1(N24@b)	PROTO-ELAMITE NUMBER ONE-N24 WITH ENCLOSURE
12		1(N24@c)	PROTO-ELAMITE NUMBER ONE-N24 WITH HATCHING
13		1(N30C)	PROTO-ELAMITE NUMBER ONE-N30C
14		1(N30C@b)	PROTO-ELAMITE NUMBER ONE-N30C WITH ENCLOSURE

#	Sign	CDLI Name	Unicode Character Name
15		1(N30C@c)	PROTO-ELAMITE NUMBER ONE-N30C WITH HATCHING
16		1(N30D)	PROTO-ELAMITE NUMBER ONE-N30D
17		1(N30D@b)	PROTO-ELAMITE NUMBER ONE-N30D WITH ENCLOSURE
18		1(N30D@c)	PROTO-ELAMITE NUMBER ONE-N30D WITH HATCHING
19		1(N34)	PROTO-ELAMITE NUMBER ONE-N34
20		1(N34@b)	PROTO-ELAMITE NUMBER ONE-N34 WITH ENCLOSURE
21		1(N39A)	PROTO-ELAMITE NUMBER ONE-N39A
22		1(N39B)	PROTO-ELAMITE NUMBER ONE-N39B
23		1(N39B@b)	PROTO-ELAMITE NUMBER ONE-N39B WITH ENCLOSURE
24		1(N39B@c)	PROTO-ELAMITE NUMBER ONE-N39B WITH HATCHING
25		1(N39C)	PROTO-ELAMITE NUMBER ONE-N39C
26		1(N45)	PROTO-ELAMITE NUMBER ONE-N45
27		1(N45@b)	PROTO-ELAMITE NUMBER ONE-N45 WITH ENCLOSURE
28		1(N46)	PROTO-ELAMITE NUMBER ONE-N46
29		1(N48)	PROTO-ELAMITE NUMBER ONE-N48
30		1(N51)	PROTO-ELAMITE NUMBER ONE-N51
31		1(N51@b)	PROTO-ELAMITE NUMBER ONE-N51 WITH ENCLOSURE

#	Sign	CDLI Name	Unicode Character Name
32		1(N51@c)	PROTO-ELAMITE NUMBER ONE-N51 WITH HATCHING
33		1(N51G)	PROTO-ELAMITE NUMBER ONE-N51G
34		1(N54)	PROTO-ELAMITE NUMBER ONE-N54

56		9(N01)	PROTO-ELAMITE NUMBER NINE-N1
57		9(N14)	PROTO-ELAMITE NUMBER NINE-N14

### 6.3 General ideographic signs

The table below shows the 1576 ideographic signs in the proposed repertoire. In the ‘Type’ column, ‘S’ denotes a ‘simple’ or individual sign; ‘CG’ denotes a ‘complex grapheme’ or general compound sign; ‘CCS’ denotes a ‘complex capacity sign’ or a compound sign with a numerical component.

#	Sign	CDLI Name	Type	Unicode Character Name
58	—	M001	S	PROTO-ELAMITE SIGN M1
59		M001+M379~c	CG	PROTO-ELAMITE SIGN M1 AND M379-C
60		M001+M379~d	CG	PROTO-ELAMITE SIGN M1 AND M379-D
61	—●	M001~b	S	PROTO-ELAMITE SIGN M1-B
62	——	M002	S	PROTO-ELAMITE SIGN M2

#	Sign	CDLI Name	Type	Unicode Character Name
63		M002+M379	CG	PROTO-ELAMITE SIGN M2 AND M379
64		M002~b	S	PROTO-ELAMITE SIGN M2-B
65		M003	S	PROTO-ELAMITE SIGN M3
66		M003~b	S	PROTO-ELAMITE SIGN M3-B
67		M003~b+M379~c	CG	PROTO-ELAMITE SIGN M3-B AND M379-C
68		M003~c	S	PROTO-ELAMITE SIGN M3-C
69		M004	S	PROTO-ELAMITE SIGN M4
70		M004~x	S	PROTO-ELAMITE SIGN M4-X
71		M005	S	PROTO-ELAMITE SIGN M5
72		M005~a	S	PROTO-ELAMITE SIGN M5-A
73		M006	S	PROTO-ELAMITE SIGN M6
74		M006@g	S	PROTO-ELAMITE SIGN M6 ALTERNATE G
75		M006@g~1	S	PROTO-ELAMITE SIGN M6 ALTERNATE G-1
		→ Possible alternate of M006@g		
76		M006@g~2	S	PROTO-ELAMITE SIGN M6 ALTERNATE G-2
		→ Possible alternate of M006@g		
77		M006~b	S	PROTO-ELAMITE SIGN M6-B
78		M006~b@g	S	PROTO-ELAMITE SIGN M6-B ALTERNATE G
79		M007~a	S	PROTO-ELAMITE SIGN M7-A
80		M007~b	S	PROTO-ELAMITE SIGN M7-B
81		M007~c	S	PROTO-ELAMITE SIGN M7-C

#	Sign	CDLI Name	Type	Unicode Character Name
82		M007~d	S	PROTO-ELAMITE SIGN M7-D
83		M009	S	PROTO-ELAMITE SIGN M9
84		M009~a	S	PROTO-ELAMITE SIGN M9-A
85		M009~c	S	PROTO-ELAMITE SIGN M9-C
86		M009~d+M346+M009~d	CG	PROTO-ELAMITE SIGN M9-D AND M346 AND M9-D
				→ M009~d is not separately enumerated in sign lists
87		M009~e	S	PROTO-ELAMITE SIGN M9-E
88		M009~f	S	PROTO-ELAMITE SIGN M9-F
89		M009~g	S	PROTO-ELAMITE SIGN M9-G

M246~d	M305+X	M341~a	M382~i	n(N14)
M250~bc	M305~e	M341~b	M384~g	x

If the above sign names are normalized, it would be possible to reduce the number of missing signs to ~340:

- remove characters such as ! and # and ,
- merge signs using consistent names, eg. 1(N1) → 1(N01); M1 → M001; M014 → M014~a; etc.
- remove proxies for missing signs, eg. X, x, X+X, etc.

## 8.6 Comparison of signs across all sources

The table below shows all 2011 signs that occur across the available sources analyzed thus far:

## 8.8 Summary of signs excluded from the repertoire

The following 54 signs that occur in the available sources have been excluded from the tentative repertoire. Some have been merged with other signs due to possible naming inconsistencies, while others have been removed altogether because they are unsuitable for encoding.

## **10 Acknowledgments**

I express my gratitude to Dr. Laura Hawkins (Near Eastern Languages and Civilizations, Harvard University) for providing information about Proto-Elamite sign names and typologies.

This project has been made possible in part by a grant from the U.S. National Endowment for the Humanities, which funded the Universal Scripts Project PR-253360-17 (part of the Script Encoding Initiative at UC Berkeley). Any views, findings, conclusions or recommendations expressed in this publication do not necessarily reflect those of the National Endowment of the Humanities.

It has also been made possible in part by funding from the Adopt-A-Character program of the Unicode Consortium and the effort is supervised by Deborah Anderson and Andrew Glass.

Figure 4: CDLI record for tablet Musée du Louvre (MDP) 17, 112, showing high-resolution image and transliteration ([https://cdli.ucla.edu/search/search\\_results.php?SearchMode=Text&ObjectID=P008310](https://cdli.ucla.edu/search/search_results.php?SearchMode=Text&ObjectID=P008310)).

The *decimal system* (Figs. 5.6a–b) was used to count discrete objects in proto-Elamite texts; it has no proto-cuneiform counterpart. A handful of texts offer fully reconstructable calculations of counted objects with summations on reverse tablet surfaces and thus a clear interpretation of the absolute values represented by the individual signs of the system. For example, Scheil (1923:no. 45), contains individual entries on the obverse surface representing  $94 + 69 + 147 + 44 + 50 + 112 + 75$  subsumed in a notation on the reverse surface equaling  $591 (5N_{23} 9N_{14} N_1)$  of counted M388 (𦪇).<sup>20</sup> For individual groups of small cattle (M346, ➊), Scheil (1905:no. 212; also Nissen *et al.* 1993:93–95) in like manner records notations representing

Excerpt from Englund (2004: 110) showing the signs 𦪇 M388 and ➊ M346.

- the same numerical signs and sign systems, but including the derivative use of bisexagesimal signs for the 1,000 and 10,000 steps of the decimal system found only in Elam (the sign for “100,” 𠁧, itself follows the productive method of placing two signs in opposition to form the next bundling step in the system); and of

Excerpt from Englund (2004: 124) showing the sign 𠁧  $1N_{23}$

not agreed upon one or the other of two possible forms,  $N_{39a}$  (𠁧) and  $N_{39b}$  (𠁨; this latter sign form might derive from the use of thumbnails to represent units smaller than the basic unit in grain metrology notations during the period of numerical tablets). By the beginning of the following period Uruk III, standardization had dictated the use of only  $N_{39a}$ . Persian accountants chose the equally plausible variant  $N_{39b}$  from the Uruk IV pool of signs.

Excerpt from Englund (2004: 140) showing the signs 𠁧  $1N_{39a}$  and 𠁨  $1N_{39b}$

Figure 5: Examples of Proto-Elamite signs used in running text.

column on its reverse. The following correlation demonstrates that the entries on the final balancing tablet correspond exactly to the entries of both texts from which it was drawn, albeit in a different sequence: the scribe here differentiated by recording on the obverse all the individuals qualified with the numerical sign  $\text{⇨}$ , on the reverse all those qualified with the numerical sign  $\text{⇨⇨}$ .

Text no.	col.	case	Text no.	col.	case	
62b obv.	I	1–5	=	62a obv.	I	1–5
	II	1	=		I	6
	II	2	=	rev.	I	3
	II	3	=		I	5
	II	4	=		I	4
	II	5	=	obv.	I	7
rev.	I	1–2	=		I	8–9
	I	3–6	=		II	1–4
	II	1–6	=		II	5–8
	II	7–8	=	rev.	I	1–2
62c obv.	I	1–4	=		I	6–9

After having booked the entries, the scribe proceeded by turning the tablet upside down, recording two subtotals within the central column of the reverse. In a last step he entered the grand total of the recorded laborers in the left column of the reverse. The first subtotal records exactly those 17 individuals who were noted on the obverse and qualified with the numerical sign  $\text{⇨}$ . These people are qualified as male and female laborers ( $\text{▷} \text{⇨}$ ) of the category  $\text{⇨} \text{⇨}$  (SAG+MA). The remaining ten laborers recorded with the numerical sign  $\text{⇨⇨}$  on the reverse of the tablet are noted separately in the second subtotal, where they are characterized through the addition of the sign  $\text{⇨}$  (ERIM).

We do not understand the exact purpose of this differentiation. In administrative texts relating to domestic animals, the same numerical sign  $\text{⇨⇨}$  was generally used to book an animal that had died during the accounting period. Consequently, one might be tempted to suggest that the ten laborers referred to in the present context were indeed dead. On the other hand, we cannot rule out the possibility that the sign was merely used to stress an as yet unspecified functional difference between the two groups of laborers. As a matter of fact, such use of explicitly different numerical signs is well documented in later accounting tradition.

Dating to approximately the same time as the Uruk III period texts from Mesopotamia are a number of administrative texts of similar contents which come from Susa and are written in the so-called proto-Elamite script. Although this script remains for the

most part undeciphered, we are able to make often far-reaching conclusions about the contents of the proto-Elamite texts, based on their formal similarity to proto-cuneiform tablets, that is, to the archaic texts from Mesopotamia, in particular insofar as the structure of documented accounts and the similar use of certain signs for objects in bookkeeping are concerned.

The proto-Elamite texts exhibit two features that clearly distinguish them from the proto-cuneiform documents, relating to sign form and text layout, respectively. One essential difference to the archaic texts from Mesopotamia is that the proto-Elamite documents were written in a linearized script, which on a superficial level tends to blur the formal and structural similarities between the two text corpora. The first signs on a proto-Elamite tablet have by and large the same function as the proto-cuneiform “subscription” (that is, signature), usually inscribed together with the final total on the reverse side of an archaic account tablet from Mesopotamia. As already demonstrated, such signatures supplied information relating to the type of transaction recorded as well as the responsibilities of the individuals involved in that particular transaction. Following the introductory sign combinations, which generally express the purpose of a proto-Elamite tablet, are individual entries, one after the other, without regard to the formal arrangement of the tablet into columns. Each entry normally includes an ideographic notation followed by a numerical one, thus diverging again from the strict sequence used in the proto-cuneiform texts. The principle of recording the total on the reverse side of the tablet, however, is adhered to by the proto-Elamite scribes.

The obverse of the proto-Elamite tablet in figure 63 lists in several columns altogether seven labor troops. The list itself is remarkably similar to the compilation on the proto-cuneiform text shown in figure 61; the proto-Elamite sign  $\text{⇨⇨}$ , moreover, corresponds in all probability to the graphically similar sign  $\text{⇨}$ , meaning “male laborer,” from the proto-cuneiform script. The number of laborers belonging to each group listed in our proto-Elamite account varies between 44 and 147. In front of each number relating to the size of a group either one or two other signs were written which, according to our findings, refer to the foreman of the gang.

In proto-Elamite texts, the numbers relating to registered individuals formed part of a numerical system which was restricted in use to the distributional area of the script itself, a region approximately identical with later Persia. Hence, that system is not to be found in the contemporary archaic texts of Mesopotamia. Apparently it was only applied in conjunction with the registration of labor gangs and herds of domestic animals. It actually constitutes the only known decimal system of this region

Figure 6: Examples of Proto-Elamite signs used in running text, with comparison to an analogous Proto-Cuneiform signs (from Nissen, Damerow, Englund 1993: 75).

from the archaic period. The following signs of this system have been identified:

	=	1
	=	10
	=	100
	=	1,000
	=	10,000

The signs of this system for the numbers 1,000 and 10,000 seem to have been borrowed from the proto-cuneiform bisexagesimal system and ascribed here new numerical values. This suggests that the system originally only consisted of the numbers 1, 10, and 100 and was only expanded at a time when centralization of the economic administration led to the necessity of recording increasingly larger numbers of laborers and domestic animals.

The structure of a second proto-Elamite example is illustrated in figures 64–65. In this account, laborers and grain rations are treated simultaneously. It reveals with a certain degree of clarity the hierarchical structure of the labor gangs known from texts dating to the later Old Sumerian period.

Two individuals stood at the top of the hierarchy attested by this text. Both probably functioned as chief supervisors of the registered laborers. Of special interest are the people under the control of the first supervisor, since it seems that they actually formed together a full force of laborers, whereas the second supervisor only administered the remainder of the listed workmen. The first labor force can be qualified as a century, since it consisted of ten gangs, of ten laborers each plus one foreman, thus forming together 11 individuals per gang. That number was recorded after the name of every foreman. The reverse side of the tablet with the totals accordingly records a sum of 111 laborers for the first chief supervisor, that is, the total of all gangs together with their respective foremen and the chief supervisor himself.

The fact that all the members of the three hierarchical groups were preceded by the sign is in agreement with the summary of the laborers, foremen, and chief supervisor in a grand total. Such comprehensive qualifications of laborers from different hierarchical levels are well known from later Mesopotamian sources. Such is, for instance, the case for the Sumerian term *guruš* during the period of the Third Dynasty of Ur. In the summations on the reverse side of the proto-Elamite tablet, the two chief supervisors are additionally qualified by the sign . This sign most likely served to underscore the special status of the two individuals, corresponding semantically and graphically to the Sumerian sign *ugula* for the foremen of laborers (both signs likely representations of sticks).

The cereal rations are always specified for two labor gangs together, that is, for 22 individuals. Following the two entries, each consisting of the sign , the name of the foreman and the numerical notation corresponding to the eleven persons of each gang, the sign , probably the proto-Elamite sign for “grain ration,” was inscribed, and finally the amount of barley distributed to the 22 individuals. The barley quantity is expressed in the proto-Elamite capacity system for grain which corresponds to the ŠE system of the archaic texts from Mesopotamia. For two complete gangs, an amount of and was required. Since in the capacity system 1 unit of replaces 6 units of , every laborer received an amount represented by  $\frac{1}{2}$ . This amount probably corresponded to the monthly ration of a laborer. Assuming that the capacity units in Susa were of the same size as those in archaic Mesopotamia, this amount would correspond to half of what a laborer was given in Mesopotamia as attested by the archaic text in figure 60 and others. The laborer in proto-Elamite Susa would thus have received only about 12 liters per month. There are, however, a number of indications that the capacity systems in the two regions were based on different unit sizes despite their identical numerical structure.

We are ill informed about the type of tasks assigned to the labor gangs whom we find documented in the proto-Elamite texts. In particular, we do not know whether their work was carried out in the immediate neighborhood of the city or on an interregional basis. From the Fara period, the period following the archaic age, however, there is enough evidence to confirm the existence of regionally organized and directed work projects. This is, for example, attested by the tablets represented in figure 66, both of which were found in the ruins of Fara, the ancient city of Šuruppak. Both texts are compilations of “conscripted work forces” (corvée workers? Sumerian *lú dab₅*) from nearly all the politically important cities of the Fara period: Uruk, Adab, Nippur, Lagash, Umma, and Šuruppak itself. For example, the first of these two tablets may be transliterated and translated in the following manner (text 66a; the sexagesimal number notations of the original appear in the translation converted into decimal numbers; see chap. 6):

Obverse:

I	2.20 <i>guruš</i> lú dab₅ <i>Unugki</i> 3.35 <i>Adabki</i> 1.14	140 laborers, corvée workers from Uruk, 215 (from) Adab, 74
II	<i>Nibruki</i> 1.50 <i>Lagaški</i> 1.06 <i>Šuruppakki</i>	(from) Nippur, 110 (from) Lagash, 66 (from) Šuruppak,
